# Audio digital delay (KARAOKE echo) BU9252S / BU9252F

The BU9252S and BU9252F are digital delays specifically for Karaoke systems. Each has an internal sample hold circuit, an 8-bit A / D and D / A converter and 2kB SRAM, and allows for the selection of one of eight delay times just by attaching an inexpensive ceramic resonator.

A digital echo system can be formed by using either of these ICs together with the BA7725S or BA7725FS.

## ● Applications

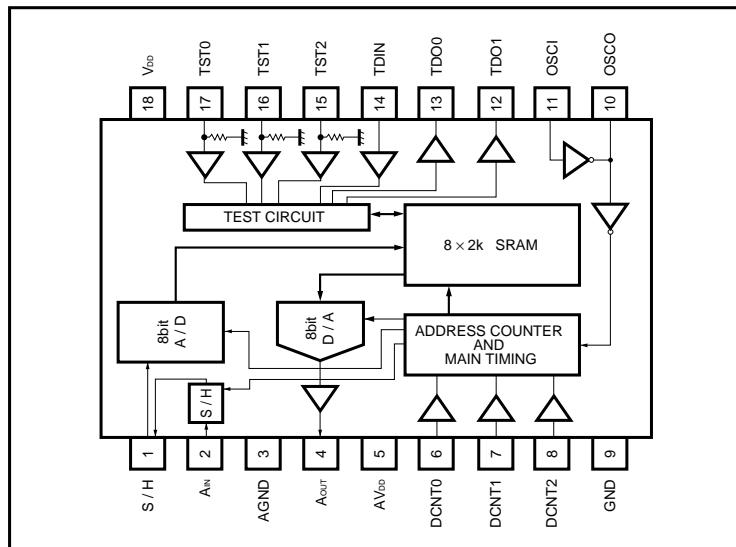

Karaoke echo system

Electronic circuits that require signal delays

## ● Features

- 1) Internal digital delay circuit.
- 2) Internal 8-bit A / D converter. Sample rate. (14.22kHz when fosc = 455kHz).
- 3) Internal 2k bytes data SRAM.
- 4) Internal 8-bit D / A converter.
- 5) CMOS design for low power consumption.
- 6) Internal sample hold circuit.
- 7) Internal feedback resistors and capacitors for oscillator circuits.

| Analog input voltage        | V <sub>AIN</sub> | 0 ~ A <sub>VDD</sub>                 | V    |
| Clock frequency             | f <sub>OSC</sub> | 200 ~ 1000                           | kHz  |
| Operating temperature       | T <sub>OPR</sub> | – 10 ~ + 70                          | °C   |

● Electrical characteristics (unless otherwise noted, Ta = 25°C, V<sub>DD</sub> = A<sub>VDD</sub> = 5V)

| Parameter                  | Symbol            | Min. | Typ. | Max. | Unit | Conditions  |
|----------------------------|-------------------|------|------|------|------|---|
| Supply current             | I <sub>DD</sub>   | —    | 3.5  | 12   | mA   | V <sub>AIN</sub> = A <sub>VDD</sub> , f <sub>OSC</sub> = 455kHz             |
| Analog output current      | I <sub>AOUT</sub> | 1    | 4    | —    | mA   | V <sub>AOUT</sub> = 1V, V <sub>AIN</sub> = 0V                               |
|                            |                   | 0.3  | 0.8  | —    | mA   | V <sub>AOUT</sub> = 0.5V <sub>DD</sub> , V <sub>AIN</sub> = V <sub>DD</sub> |
| Analog input impedance     | R <sub>AIN</sub>  | 12   | 25   | 60   | kΩ   | *   |
| A / D to D / A precision   | RES               | —    | 2    | —    | LSB  |   |
| OSCO output "L" voltage    | V <sub>LOSC</sub> | —    | 0.6  | 1.2  | V    | I <sub>OL</sub> = 100μA   |
| OSCO output "H" voltage    | V <sub>HOSC</sub> | 3.8  | 4.4  | —    | V    | I <sub>OH</sub> = – 100μA   |
| OSCI feedback loop current | I <sub>OSCI</sub> | 1    | 6    | 20   | μA   | V <sub>OSCI</sub> = V <sub>DD</sub>   |
| Oscillation capacity       | —                 | —    | 150  | —    | pF   |   |

\* The bias circuit is impedance.

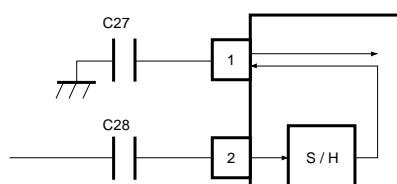

### ●Circuit operation

#### (1) External capacitor for signal input pin

Audio signals compressed by the BA7725S or BA7725FS have their DC component removed by an AC coupling capacitor and are then input to pin 2 of BU9252S or BU9252F. At this stage, level deviations occur because the input signal is capacitor-divided by this AC coupling capacitor C28 and by sampling hold capacitor C27 connected to pin 1.

To prevent this, make sure that C27 is much lower than C28.

(Note: The numbers of external components are the numbers used in the system application example.)

The sample-held analog signal is converted to digital by the serial 8-bit A / D converter and then temporarily stored in the internal SRAM (2k bytes).

#### (2) Relationship between oscillation frequency (CLK) and delay time

Sample rate  $F = f_{osc} / 32$  ( $f_{osc}$ : oscillation frequency)

$$F = 14.22\text{kHz} \text{ at } f_{osc} = 455\text{kHz}$$

Sample period  $T = 1 / F$

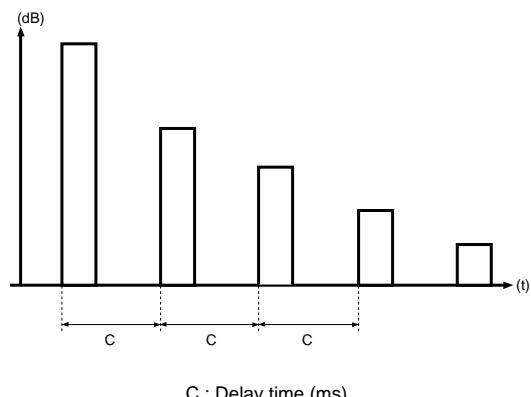

Delay time  $Dtime = T \times \text{number of counts}$

The delay time can be set to any of the eight settings shown below by setting the logic inputs of terminals DCNT0 through DCNT2.

| Logic input |       |       | Count       | Delay time (ms) (when $f_{osc} = 455\text{kHz}$ ) |
|-------------|-------|-------|-------------|---|
| DCNT1       | DCNT2 | DCNT0 | BU9252S / F | BU9252S / F                                       |
| 0           | 0     | 0     | 256         | 18.00   |
| 0           | 0     | 1     | 512         | 36.01   |
| 0           | 1     | 0     | 768         | 54.01   |
| 0           | 1     | 1     | 1024        | 72.02   |
| 1           | 0     | 0     | 1280        | 90.02   |
| 1           | 0     | 1     | 1536        | 108.03  |
| 1           | 1     | 0     | 1792        | 126.03  |
| 1           | 1     | 1     | 2048        | 144.04  |

#### (3) Delay timer settings

The delay time (i.e., the length of time the signal is stored in the SRAM) can be set to any of eight settings between the maximum and minimum delay times by setting pins 6, 7 and 8 to the combination of logic signal inputs that results in the corresponding number of counts. The maximum and minimum delay times are determined by the oscillation frequency of the attached ceramic resonator.

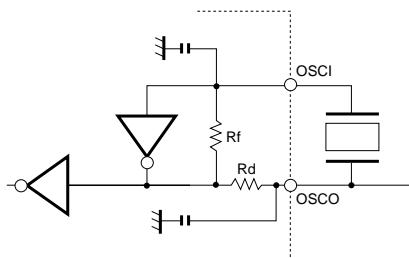

Maximum and minimum delay times when using 300kHz, 375kHz and 455kHz ceramic oscillators

| Delay time (ms) |       |        |       |        |       |
|-----------------|-------|--------|-------|--------|-------|
| 300kHz          |       | 375kHz |       | 455kHz |       |
| Max.            | Min.  | Max.   | Min.  | Max.   | Min.  |
| 218.45          | 27.30 | 174.76 | 21.85 | 144.04 | 18.00 |

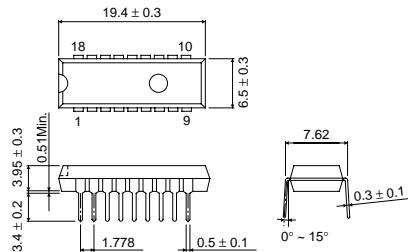

#### (4) Peripheral components of the ceramic oscillator

An oscillator circuit can be configured simply by attaching a 455kHz ceramic resonator.
