Notes on Electrical Characteristics:

Guaranteed by design and characterization, not 100% tested in production.

Single-ended measurement at crossing point. Value is maximum – minimum over all time. DC value of common mode is not important due to the blocking cap.

Minimum Frequency is a result of 0.5% down spread spectrum

Differential measurement through the range of ± 100 mV, differential signal must remain monotonic and within slew rate spec when crossing through this region.

⁵ Defined as the total variation of all crossing voltages of CLK rising and CLK# falling. Matching applies to rising edge rate of CLK and falling edge of CLK#. It is measured using a ± 75 mV window centered on the average cross point where CLK meets CLK#.

⁶ Max difference of t_{CYCLE} between any two adjacent cycles.

⁷ Accumulated tjc. over a 10 μ s time period, measured with JIT2 TIE at 50ps interval.

⁸ VD(PK-PK) is the overall magnitude of the differential signal.

⁹ VD(min) is the amplitude of the ring-back differential measurement, guaranteed by design, that ring-back will not cross 0V VD. VD(max) is the largest amplitude allowed.

¹⁰ The difference in magnitude of two adjacent VD_DC measurements. VD_DC is the stable post overshoot and ring-back part of the signal.

¹¹ All Long Term Accuracy and Clock Period specifications are guaranteed assuming that REFOUT is at 14.31818MHz
