# 15 Output PCIe G2/QPI Differential Buffer with 2:1 Input Mux

9EX21501A

## Description

The **ICS9EX21501** provides 15 output clocks for PCIe Gen2 (100MHz) or QPI (133MHz) applications. A differential CPU clock from a CK410B+ main clock generator, such as the ICS932S421, drives the **ICS9EX21501**. In fanout mode, the **ICS9EX21501** provides outputs up to 400MHz. A 2:1 input mux allows selection between local and remote clock sources.

## Recommended Application:

15 Output PCIe G2/QPI Differential Buffer with 2:1 input mux

## Key Specifications:

- DIF output cycle-to-cycle jitter < 50ps
- DIF output-to-output skew < 150 ps
- PCIe Gen2 compliant phase jitter
- QPI 6.4Gb/s 12UI compliant phase jitter

## Features/Benefits:

- Output clock frequencies up to 400 MHz/supports wide range of applications
- 4 Selectable SMBus addresses/multiple devices can share SMBus segment
- SMBus address independent of PLL operating mode/maximum flexibility
- Dedicated CKPWRGD/PD# and VDDA pins/Easy board design
- 8 Dedicated OE# and 2 Group OE# pins/Support for hardware clock management

## Output Features:

- 15 - 0.7V current-mode differential HCSL output pairs
- Supports zero delay buffer mode and fanout mode
- Selectable PLL bandwidth
- 80-150 MHz in PLL Mode
- 33-400 MHz operation in Bypass mode

This results in a +/-150mV window around differential 0V.<sup>4</sup>Matching applies to rising edge rate of Clock / falling edge rate of Clock#. It is measured in a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope uses for the edge rate calculations.<sup>5</sup>Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).<sup>6</sup>The total variation of all Vcross measurements in any system. Note that this is a subset of V\_cross\_min/max (V\_cross absolute) allowed. The intent is to limit Vcross induced modulation by setting V\_cross\_delta to be smaller than V\_cross absolute.**Electrical Characteristics - Current Consumption**TA = T<sub>COM</sub> or T<sub>IND</sub>; Supply Voltage VDD/VDDA = 3.3 V +/-5%, See Test Loads for Loading Conditions

### Notes for preceding table:

- Measured into fixed 2 pF load cap. Input to output skew is measured at the first output edge following the corresponding input.
- Measured from differential cross-point to differential cross-point.
- All Bypass Mode Input-to-Output specs refer to the timing between an input edge and the specific output edge created by it.
- This parameter is deterministic for a given device
- Measured with scope averaging on to find mean value.
- Long-term variation from nominal of input-to-output skew over temperature and voltage for a single device.
- Measured as maximum pass band gain. At frequencies within the loop BW, highest point of magnification is called PLL jitter peaking.
- Guaranteed by design and characterization, not 100% tested in production.
- Measured at 3 db down or half power point.
- Duty cycle distortion is the difference in duty cycle between the output and the input clock when the device is operated in bypass mode
- Measured from differential waveform
- This parameter is measured at the outputs of two separate ICS9EX21501 devices driven by a single CK410B+. The ICS9EX21501's must be set to high bandwidth. Differential phase jitter is the accumulation of the phase jitter not shared by the outputs (eg. not including the affects of spread spectrum). Target ranges of consideration are agents with BW of 1-22Mhz and 11-33Mhz.
- Differential spread spectrum tracking error is the difference in spread spectrum tracking between two ICS9EX21501 devices. This parameter is measured at the outputs of two separate ICS9EX21501 devices driven by a single CK410B+ in Spread Spectrum mode. The ICS9EX21501's must be set to high bandwidth. The spread spectrum characteristics are: maximum of 0.5%, 30-33KHz modulation frequency, triangle profile.

## General SMBus serial interface information for the 9EX21501

### How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address D4<sub>(H)</sub>
- ICS clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- ICS clock will **acknowledge**
- Controller (host) sends the data byte count = X
- ICS clock will **acknowledge**
- Controller (host) starts sending **Byte N through Byte N + X - 1**
- ICS clock will **acknowledge** each byte **one at a time**
- Controller (host) sends a Stop bit

### How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the write address D4<sub>(H)</sub>
- ICS clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- ICS clock will **acknowledge**
- Controller (host) will send a separate start bit.
- Controller (host) sends the read address D5<sub>(H)</sub>
- ICS clock will **acknowledge**
- ICS clock will send the data byte count = X
- ICS clock sends **Byte N + X - 1**
- ICS clock sends **Byte 0 through byte X (if X<sub>(H)</sub> was written to byte 8).**
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

"LF" suffix to the part number are the Pb-free configuration and are RoHS compliant.

"A" is the revision designator (will not correlate with datasheet revision).

Due to package size constraints actual top side marking may differ from the full orderable part number.

Revision History

Rev.	Who	Issue Date	Description	Page #
0.1	RDW	4/6/2009	Initial Release	-
0.2	RDW	4/7/2008	1. Lowered IDD 2. Updated block diagram to correct typo's 3. Corrected Pin descriptions 4. Corrected Frequency/functionality table references to Byte 2, should be Byte 0 5. Updated Power Groups Table 6. Corrected typo in SMBus Address Selection Table. 7. Corrected references to 9EX1501 to be 9EX21501	Various
0.3	RDW	11/24/2009	1. Added more detailed Idd numbers to DS 2. Added industrial temp Idd numbers and ordering information	
0.4	RDW	2/4/2010	1. Corrected Pin Description for Pin 52. There was discrepancy between the Frequency/Functionality Table and the Pin Description. The Pin Description was not correct. Instead of the pin description defining functionality, it now refers to the Frequency Functionality Table for the definition.	4
0.5	RDW	1/18/2011	1. Reformatted Electrical Tables to latest template 2. Updated electrical tables with characterized data 3. Added Test loads diagram and table 4. Move to Final	Various
