**Serial Data Interface**

The W311 features a two-pin, serial data interface that can be used to configure internal register settings that control particular device functions.

**Data Protocol**

The clock driver serial protocol supports byte/word write, byte/word read, block write and block read operations from the

controller. For block write/read operation, the bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. For byte/word write and byte read operations, system controller can access individual indexed byte. The offset of the indexed byte is encoded in the command code.

The definition for the command code is defined in *Table 2*.

**Table 1.**

Bit	Descriptions
7	0 = Block read or block write operation 1 = Byte/Word read or byte/word write operation
6:0	Byte offset for byte/word read or write operation. For block read or write operations, these bits need to be set at '0000000'.

**Programmable Output Frequency, Watchdog Timer and Recovery Output Frequency Functional Description**

The Programmable Output Frequency feature allows users to generate any CPU output frequency from the range of 50 MHz to 248 MHz. Cypress offers the most dynamic and the simplest programming interface for system developers to utilize this feature in their platforms.

The Watchdog Timer and Recovery Output Frequency features allow users to implement a recovery mechanism when the system hangs or getting unstable. System BIOS or other control software can enable the Watchdog timer before they attempt to make a frequency change. If the system hangs and a Watchdog timer time-out occurs, a system reset will be generated and a recovery frequency will be activated.

All of the related registers are summarized in *Table 7*.

**How to Program CPU Output Frequency**

When the programmable output frequency feature is enabled (Pro\_Freq\_EN bit is set), the CPU output frequency is determined by the following equation:

$$F_{cpu} = G * (N+3)/(M+3)$$

“N” and “M” are the values programmed in Programmable Frequency Select N-Value Register and M-Value Register, respectively.

“G” stands for the PLL Gear Constant, which is determined by the programmed value of FS[4:0] or SEL[4:0]. The value is listed in *Table 5*. The ratio of (N+3) and (M+3) need to be greater than “1” [(N+3)/(M+3) > 1].

*Table 7* lists set of N and M values for different frequency output ranges. This example use a fixed value for the M-Value Register and select the CPU output frequency by changing the value of the N-Value Register.

**Table 7. Examples of N and M Value for Different CPU Frequency Range**

Frequency Ranges	Gear Constants	Fixed Value for M-Value Register	Range of N-Value Register for Different CPU Frequency
50 MHz–129 MHz	48.00741	93	97–255
130 MHz–248 MHz	48.00741	45	127–245
