GTLP6C816
GTLP/TTL 1:6 Clock Driver

General Description

The GTLP6C816 is a clock driver that provides TTL to GTLP signal level translation (and vice versa). The device provides a high speed interface between cards operating at TTL logic levels and a backplane operating at GTLP logic levels. High speed backplane operation is a direct result of GTLP's reduced output swing (<1V), reduced input threshold levels and output edge rate control. The edge rate control minimizes bus settling time. GTLP is a Fairchild Semiconductor derivative of the Gunning Transceiver logic (GTL) JEDEC standard JESD8-3.

Fairchild's GTLP has internal edge-rate control and is process, voltage, and temperature (PVT) compensated. Its function is similar to BTL and GTL but with different output levels and receiver threshold. GTLP output LOW level is typically less than 0.5V, the output level HIGH is 1.5V and the receiver threshold is 1.0V.

Features

- Interface between LVTTL and GTLP logic levels
- Designed with edge rate control circuitry to reduce output noise on the GTLP port
- V_{REF} pin provides external supply reference voltage for receiver threshold adjustibility
- Special PVT compensation circuitry to provide consistent performance over variations of precess, supply voltage and temperature
- TTL compatible driver and control inputs
- Designed using Fairchild advanced CMOS technology
- Bushold data inputs on A port to eliminate the need for external pull-up resistors for unused inputs
- Power up/down and power off high impedance for live insertion
- 5V over voltage tolerance on LVTTL ports
- Open drain on GTLP to support wired-or connection
- A Port source/sink −24mA/+24mA
- B Port sink +50mA
- 1:6 fanout clock driver for TTL port
- 1:2 fanout clock driver for GTLP port

Ordering Code:

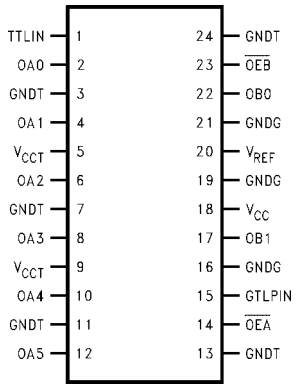
Connection Diagram



Functional Description

The GTLP6C816 is a clock driver providing TTL-to-GTLP clock translation, and GTLP-to-TTL clock translation in the same package. The TTL-to-GTLP direction is a 1:2 clock driver path with a single Enable pin ($\overline{OEB}$). For the GTLP-to-TTL direction the clock receiver path is a 1:6 buffer with a single Enable control ($\overline{OEA}$). Data polarity is inverting for both directions.

DC Electrical Characteristics (Continued)

Symbol		Test Conditions		Min	Typ (Note 4)	Max	Units
C_{IN}	Control Pins/GTLPIN/ TTLIN		$V_I = V_{CC}$ or 0		3.7		pF
C_{OUT}	OAn Port		$V_I = V_{CC}$ or 0		7		pF
	OBn Port		$V_I = V_{CC}$ or 0		7		

Note 4: All typical values are at $V_{CC} = 5.0V$ and $T_A = 25°C$.

Note 5: GTLP V_{REF} and V_{TT} are specified to 2% tolerance since signal integrity and noise margin can be significantly degraded if these supplies are noisy. In addition, V_{TT} and R_{TERM} can be adjusted to accommodate backplane impedances other than 50Ω, within the boundaries of not exceeding the DC Absolute I_{OL} ratings. Similarly V_{REF} can be adjusted to compensate for changes in V_{TT}.

AC Electrical Characteristics

Over recommended range of supply voltage and operating free air temperature. $V_{REF} = 1.0V$ (unless otherwise noted).

$C_L = 30$ pF for OBn Port and $C_L = 50$ pF for OAn Port.

Note 6: All typical values are at $V_{CC} = 5.0V$ and $T_A = 25°C$.

Note 7: Skew specs are given for specific worst case V_{CC} Temp. Skew values between the OBn outputs could vary on the backplane due to loading and impedance seen by the device.
