DESCRIPTION:

The IDT5T9310 2.5V differential clock buffer is a user-selectable differential input to ten LVDS outputs. The fanout from a differential input to ten LVDS outputs reduces loading on the preceding driver and provides an efficient clock distribution network. The IDT5T9310 can act as a translator from a differential HSTL, eHSTL, LVEPECL (2.5V), LVPECL (3.3V), CML, or LVDS input to LVDS outputs. A single-ended 3.3V / 2.5V LVTTTL input can also be used to translate to LVDS outputs. The redundant input capability allows for an asynchronous change-over from a primary clock source to a secondary clock source. Selectable reference inputs are controlled by SEL.

The IDT5T9310 outputs can be asynchronously enabled/disabled. When disabled, the outputs will drive to the value selected by the GL pin. Multiple power and grounds reduce noise.

APPLICATIONS:

- Clock distribution

\bar{A} _[1:2]	I	Adjustable ^(1,4)	Complementary clock inputs. \bar{A} _[1:2] is the complementary side of A _[1:2] . For LVTTTL single-ended operation, \bar{A} _[1:2] should be set to the desired toggle voltage for A _[1:2] : 3.3V LVTTTL V _{REF} = 1650mV 2.5V LVTTTL V _{REF} = 1250mV
\bar{G} ₁	I	LVTTTL	Gate control for differential outputs Q ₁ and \bar{Q} ₁ through Q ₅ and \bar{Q} ₅ . When \bar{G} ₁ is LOW, the differential outputs are active. When \bar{G} ₁ is HIGH, the differential outputs are asynchronously driven to the level designated by GL ⁽²⁾ .
\bar{G} ₂	I	LVTTTL	Gate control for differential outputs Q ₆ and \bar{Q} ₆ through Q ₁₀ and \bar{Q} ₁₀ . When \bar{G} ₂ is LOW, the differential outputs are active. When \bar{G} ₂ is HIGH, the differential outputs are asynchronously driven to the level designated by GL ⁽²⁾ .

\bar{P} _D	I	LVTTTL	Power-down control. Shuts off entire chip. If LOW, the device goes into low power mode. Inputs and outputs are disabled. Both "true" and "complementary" outputs will pull to V _{DD} . Set HIGH for normal operation. ⁽³⁾
V _{DD}		PWR	Power supply for the device core and inputs
GND		PWR	Power supply return for all power
NC			No connect; recommended to connect to GND

NOTES:

- Inputs are capable of translating the following interface standards:
Single-ended 3.3V and 2.5V LVTTTL levels
Differential HSTL and eHSTL levels
Differential LVEPECL (2.5V) and LVPECL (3.3V) levels
Differential LVDS levels
Differential CML levels
- Because the gate controls are asynchronous, runt pulses are possible. It is the user's responsibility to either time the gate control signals to minimize the possibility of runt pulses or be able to tolerate them in down stream circuitry.
- It is recommended that the outputs be disabled before entering power-down mode. It is also recommended that the outputs remain disabled until the device completes power-up after asserting \bar{P} _D.
- The user must take precautions with any differential input interface standard being used in order to prevent instability when there is no input signal.

DIFFERENTIAL AC TIMING WAVEFORMS

Output Propagation and Skew Waveforms

NOTES:

1. Pulse skew is calculated using the following expression:

$$t_{SK(P)} = |t_{PHL} - t_{PLH}|$$

Note that the t_{PHL} and t_{PLH} shown above are not valid measurements for this calculation because they are not taken from the same pulse.

2. AC propagation measurements should not be taken within the first 100 cycles of startup.

Differential Gate Disable/Enable Showing Runt Pulse Generation

NOTE:

1. As shown, it is possible to generate runt pulses on gate disable and enable of the outputs. It is the user's responsibility to time their \overline{Gx} signals to avoid this problem.

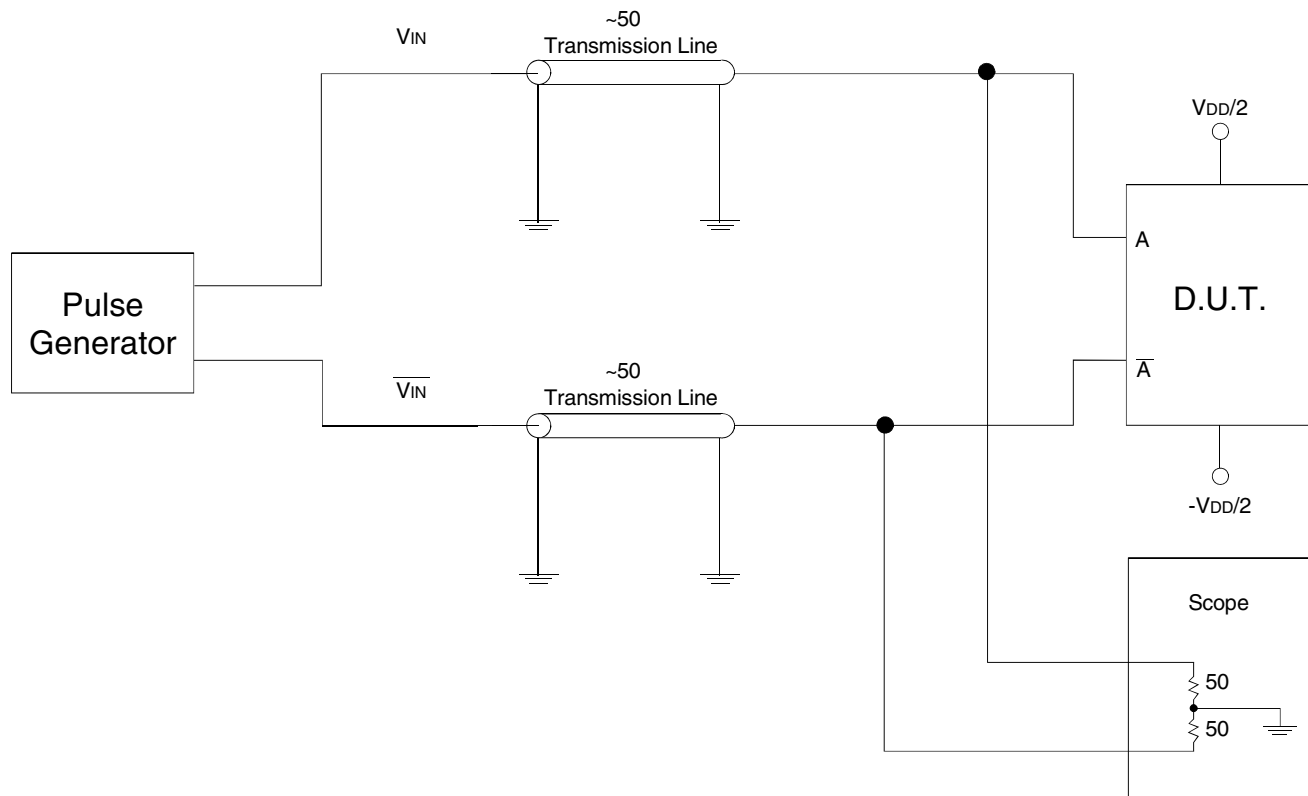

Power Down Timing

NOTES:

1. It is recommended that outputs be disabled before entering power-down mode. It is also recommended that the outputs remain disabled until the device completes power-up after asserting \overline{PD} .
2. The POWER DOWN TIMING diagram assumes that GL is HIGH.
3. It should be noted that during power-down mode, the outputs are both pulled to V_{DD} . In the POWER DOWN TIMING diagram this is shown when $Qn-\overline{Qn}$ goes to $V_{DIF} = 0$.

NOTES:

- Specifications only apply to "Normal Operations" test condition. The T_{IA}/E_{IA} specification load is for reference only.
- The scope inputs are assumed to have a 2pF load to ground. T_{IA}/E_{IA} - 644 specifies 5pF between the output pair. With C_L = 8pF, this gives the test circuit appropriate 5pF equivalent load.
