PLL frequency synthesizer for tuners BU2624AF

The BU2624AF is a PLL frequency synthesizer IC designed for use in car stereos, high-fidelity audio systems, and CD radio cassettes.

Featuring low current dissipation, low superfluous radiation, two frequency measurement counter systems, and two phase comparison outputs, this chip is ideal for high-performance multi-band systems.

Applications

Car stereos, high-fidelity audio systems, radio cassettes, receivers, and other frequency generating devices

Features

- Built-in high-speed prescaler can divide 130MHzVCO.
- Low current dissipation (during operation: 6.0mA, PLL OFF: 300μA Typ.)
- 3) Seven standard frequencies: 50kHz, 25kHz, 12.5kHz, 10kHz, 9kHz, 5kHz, and 1kHz.
- 4) Two counters for intermediate frequency detection

- 5) Unlock detection circuit
- 6) Five output ports (open drain)
- 7) SD input port
- 8) Two charge pump outputs
- 9) Serial data input (CE, CK, DA)
- 10) Control of phase comparison output

1	1	ON Gate time = 16 ms	ON	

(10) TS: Test data (0) is input

^{*} FMIN = pulldown, AMIN = pulldown, PD = high impedance

Frequency counter

(1) Structure

(2) How the frequency counter operates

When control data CT equals 1, the 20-bit counter and the amp go into operation. When CT equals 0, amp input goes to pulldown and the counter is reset.

Measuring time (gate pulse) is selected (8 ms/16 ms) on the basis of control data GT.

When control data CT equals 0, the counter is reset.

(3) Explanation of output data

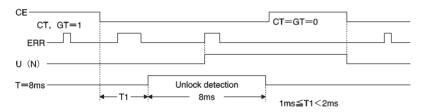

D0: LSB D19: MSB

Unlock detection

When control data GT equals 1, or CT equals 1, the unlock detection circuit goes into operation for 8ms.

When CT equals 1, the unlock detection circuits stops operating before the frequency counter gate pulse is emitted.

When CT equals 0, or GT equals 0, the unlock detection circuit is reset.

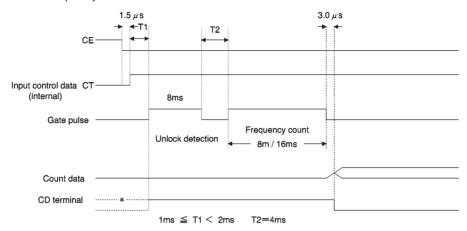

Explanation of the output data

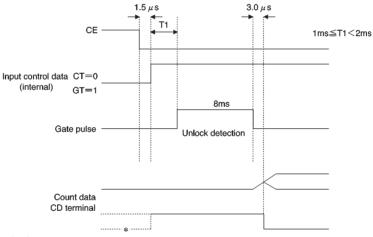

U0 U1 U2 U3
0 0 0 0 0 ERR < 1.1
$$\mu$$
s
1 0 0 0 1.1 μ s < ERR < 2.2 μ s
1 1 0 0 2.2 μ s < ERR < 3.3 μ s
1 1 1 0 3.3 μ s < ERR < 4.4 μ s
1 1 1 1 4.4 μ s < ERR

Frequency counter and unlock detection

(1) When CT = 1: Frequency count and unlock detection are carried out.

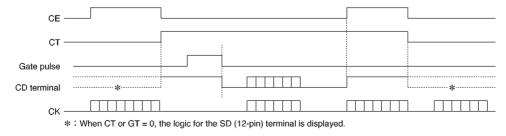

(2) When CT = 0 and GT = 1: Only unlock detection is carried out.

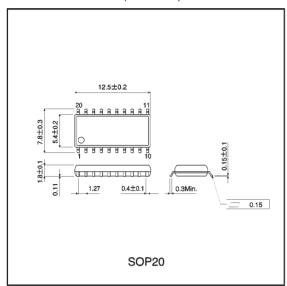

Explanation of CD terminal

When frequency measurement or unlock detection is finished, the CD terminal goes to LO to indicate that the count and unlock detection have finished.

It also synchronizes with CK to output counter data. When the next data is input, it goes to HI.
