- 1.本站收集的数据手册和产品资料都来自互联网，版权归原作者所有。如读者和版权方有任何异议请及时告之，我们将妥善解决。
- 2.本站提供的中文数据手册是英文数据手册的中文翻译，其目的是协助用户阅读，该译文无法自动跟随原稿更新，同时也可能存在翻译上的不当。建议读者以英文原稿为参考以便获得更精准的信息。
- 3.本站提供的产品资料，来自厂商的技术支持或者使用者的心得体会等，其内容可能存在描述上的差异，建议读者做出适当判断。
- 4.如需与我们联系，请发邮件到marketing@iczoom.com，主题请标有“数据手册”字样。

## Read Statement

1. The datasheets and other product information on the site are all from network reference or other public materials, and the copyright belongs to the original author and original published source. If readers and copyright owners have any objections, please contact us and we will deal with it in a timely manner.
2. The Chinese datasheets provided on the website is a Chinese translation of the English datasheets. Its purpose is for reader's learning exchange only and do not involve commercial purposes. The translation cannot be automatically updated with the original manuscript, and there may also be improper translations. Readers are advised to use the English manuscript as a reference for more accurate information.
3. All product information provided on the website refer to solutions from manufacturers' technical support or users the contents may have differences in description, and readers are advised to take the original article as the standard.
4. If you have any questions, please contact us at marketing@iczoom.com and mark the subject with "Datasheets" .

### DISTINCTIVE CHARACTERISTICS

- Ideal for low power sensitive applications
- Low standby power (normal and reverse)
- Automatic on-chip battery switching
- On-chip thermal management
- On-chip thermal shutdown
- -20 V to -60 V battery operation
- Programmable current limit
- Programmable resistive feed
- Programmable loop-detect threshold
- Selectable overhead for metering applications
- Two-wire impedance set by single external impedance
- On-chip ring and test relay drivers and relay snubber circuits
- Polarity reversal (full transmission)
- Loop and ground-key detector
- Comparator for ring-trip detection
- Ground-start capability
- On-hook transmission

### BLOCK DIAGRAM

**ORDERING INFORMATION**

**Standard Products**

Zarlink standard products are available in several packages and operating ranges. The order number (Valid Combination) is formed by a combination of the elements below.

Valid Combinations		
Le79489*	(Blank)	
	-2	DJC <sup>1, 2</sup>
	-3	

**Valid Combinations**

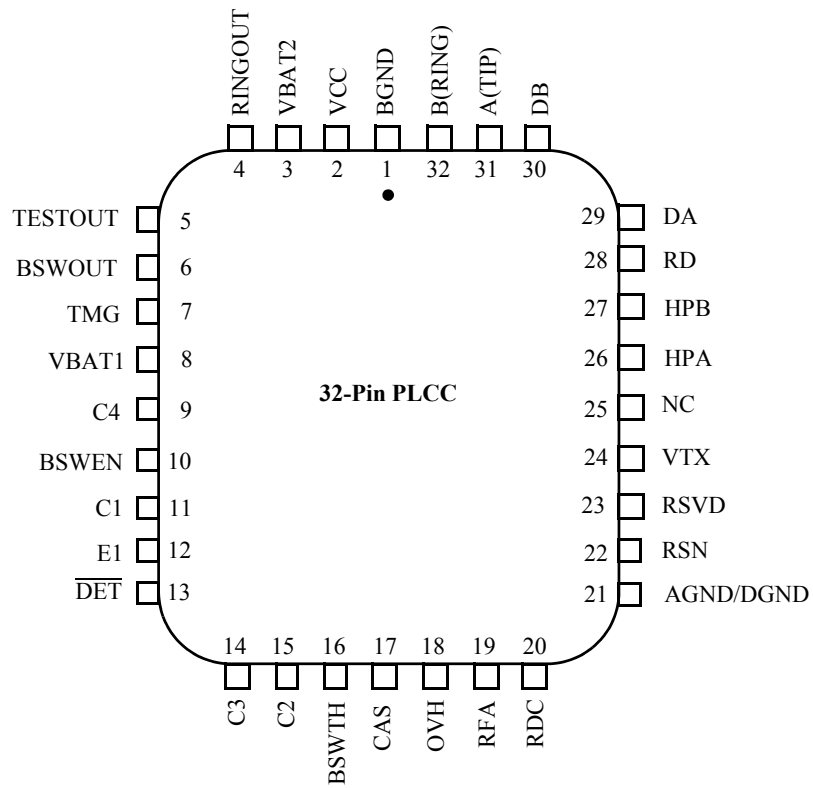

Valid Combinations list configurations planned to be supported in volume for this device. Contact Zarlink sales to confirm availability of specific valid combinations and to obtain additional data on Zarlink's standard military-grade products.

1. For delivery using a tape and reel packing system, add a "T" suffix to the OPN (Ordering Part Number) when placing an order.
2. The green package meets RoHS Directive 2002/95/EC of the European Council to minimize the environmental impact of electrical equipment.

*\*Zarlink reserves the right to fulfill all orders for this device with parts marked with the "Am" part number prefix, until such time as all inventory bearing this mark has been depleted. It should be noted that parts marked with either the "Am" or the "Le" part number prefix are equivalent devices in terms of form, fit, and function. The only difference between the two is in the part number prefix appearing on the topside mark.*

**CONNECTION DIAGRAMS**

**Top View**

**Notes:**

1. Pin 1 is marked for orientation.
2. NC = No Connect
3. RSVD = Reserved. Do not connect to this pin.

**PIN DESCRIPTIONS**

Pin Names	Type	Description
AGND/DGND	Gnd	Analog and Digital ground.
A(TIP)	Output	Output of A(TIP) power amplifier.
BGND	Gnd	Battery (power) ground.
B(RING)	Output	Output of B(RING) power amplifier.
BSWEN	—	Battery Switch Control. Internally connected to automatic battery switch circuitry. BSWEN can be overridden by external logic. BSWEN Low connects VBAT1 to VBAT2. BSWEN High disconnects VBAT1 from VBAT2.
BSWOUT	Output	Buffered Output. Internally connected to battery switch circuitry. The output is open-collector with a built-in pull-up resistor. BSWOUT Low indicates VBAT1 is connected to VBAT2. BSWOUT High indicates VBAT1 is disconnected from VBAT2. This output is valid only in the Active states.
BSWTH	Input	Input for setting automatic battery switch threshold. Normally tied to Battery 2. Tie to ground for manual switching.
C3–C1	Input	Decoder. TTL compatible. C3 is MSB and C1 is LSB.
C4	Input	Test Relay Input – Active Low. 1 = Off. 0 = On.
CAS	Capacitor	Anti-sat pin for capacitor to filter reference voltage when operating in anti-sat region.
DA	Input	Ring-trip negative. Negative input to ring-trip comparator.
DB	Input	Ring-trip positive. Positive input to ring-trip comparator.
$\overline{DET}$	Output	Switchhook detector. When enabled, a logic Low indicates the selected detector is tripped. The detector is selected by the logic inputs (C3–C1). The output is open-collector with a built-in 15 k $\Omega$ pull-up resistor.
E1	Input	Ground-Key Detect Select. E1 = 1 selects the hook switch detector. E1 = 0 selects the ground-key detector. In the Tip Open state, ground key is selected independent of E1.
HPA	Capacitor	High-Pass Filter Capacitor. A(TIP) side of high-pass filter capacitor.
HPB	Capacitor	High-Pass Filter Capacitor. B(RING) side of high-pass filter capacitor.
NC	—	No connect. This pin not internally connected.
OVH	Input	Overhead Control. Logic High enables minimized nonmetering overhead. Logic Low enables 2.2 V metering DC overhead. TTL-compatible.
RD	Resistor	Detector resistor. Detector threshold set and filter pin.
RDC	Resistor	DC feed resistor. Connection point for the DC feed current programming network. The other end of the network connects to the receiver summing node (RSN). Connection point for the DC feed current programming network. The other end of the network connects to RSN. $V_{RDC}$ is negative for normal polarity and positive for reverse polarity.
RFA	—	Resistive feed adjust. Adjust the DC feed resistance gain coefficient, GDC, with external resistor connected to ground.
RINGOUT	Output	Ring Relay Driver. Open-collector driver with emitter internally connected to BGND.
RSN	Input	Receive Summing Node. The metallic current (AC and DC) between A(TIP) and B(RING) is equal to 500 times the current into this pin. The networks that program receive gain, two-wire impedance, and feed current all connect to this node.
RSVD	—	Reserved. These pins are reserved for Zarlink use. Make no connection to these pins.
TESTOUT	Output	Test Relay Driver. Open collector driver with emitter internally connected to AGND.
TMG	—	Thermal Management. External resistor connects this pin to VBAT2 to offload power dissipation from SLIC. Functions during normal polarity, Active state.
VBAT1	Battery	Most negative battery supply and substrate connection.
VBAT2	Battery	Battery supply for output power amplifiers. Switched to VBAT1 by BSWEN.
VCC	Power	+5 V power supply.
VTX	Output	Transmit Audio. This output is a 0.5066 unity gain version of the A(TIP) and B(RING) metallic voltage. VTX also sources the two-wire input impedance programming network.
Exposed Pad	Battery	This must be electrically tied to VBAT1.

**ABSOLUTE MAXIMUM RATINGS**

Storage temperature	−55°C to +150°C
With respect to AGND/DGND:	
V <sub>CC</sub>	−0.4 V to +7.0 V
V <sub>BAT1</sub>	
Continuous	+0.4 V to −70 V
10 ms	+0.4 V to −75 V
V <sub>BAT2</sub> and BSWTH	+0.4 V to V <sub>BAT1</sub>
BGND	+3 V to −3 V
A(TIP) or B(RING) with respect to BGND:	
Continuous	V <sub>BAT1</sub> to +1 V
10 ms (f = 0.1 Hz)	−70 V to +5 V
1 μs (f = 0.1 Hz)	−80 V to +8 V
250 ns (f = 0.1 Hz)	−90 V to +12 V
Current from A(TIP) or B(RING)	±150 mA
TESTOUT/RINGOUT/current	80 mA
TESTOUT/RINGOUT/voltage	BGND to +7 V
TESTOUT/RINGOUT/transient	BGND to +10 V
DA and DB inputs	
Voltage on ring-trip inputs	V <sub>BAT1</sub> to 0 V
Current on ring-trip inputs	±10 mA
C4–C1, BSWEN, OVH, E1	
Input voltage	−0.4 V to V <sub>CC</sub> + 0.4 V
Maximum power dissipation, continuous*	
T <sub>A</sub> = 70°C, No heat sink (see note):	
In 32-pin PLCC package	1.7 W
Thermal data (θ <sub>JA</sub> )	
In 32-pin PLCC package	43°C/W typ
ESD immunity (HBM)	JESD22 Class 1C compliant

\* Thermal limiting circuitry on chip will shut down the circuit at a junction temperature of about 165°C. Continuous operation above 145°C junction temperature may degrade device reliability.

Stresses above those listed under Absolute Maximum Ratings may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to Absolute Maximum Ratings for extended periods may affect device reliability.

**Package Assembly**

Green package devices are assembled with enhanced, environmental compatible lead-free, halogen-free, and antimony-free materials. The leads possess a matte-tin plating which is compatible with conventional board assembly processes or newer lead-free board assembly processes. The peak soldering temperature should not exceed 245°C during printed circuit board

**OPERATING RANGES****Commercial (C) Devices**

Ambient temperature	−40°C to +85°C*
V <sub>CC</sub>	4.75 V to 5.25 V
BAT1	−40.5 V to −60 V
BAT2	−20 V to BAT1
AGND/DGND	0 V
BGND with respect to GND	−100 mV to +100 mV
Load resistance on VTX to GND	20 kΩ min

Operating ranges define those limits over which the functionality of the device is guaranteed by production testing.

\*Zarlink guarantees the performance of this device over commercial (0 to 70°C) and industrial (−40 to 85 °C) temperature ranges by conducting electrical characterization over each range and by conducting a production test with single insertion coupled to periodic sampling. These characterization and test procedures comply with section 4.6.2 of Bellcore TR-TSY-000357 Component Reliability Assurance Requirements for Telecommunications Equipment.

**ELECTRICAL CHARACTERISTICS**

Description	Test Conditions (See Note 1)	Min	Typ	Max	Unit	Note	
<b>Transmission Performance</b>							
2-wire return loss (See Test Circuit D)	200 Hz to 3.4 kHz	26			dB	4, 6	
Analog output ( $V_{TX}$ ) impedance			3	20	$\Omega$	4	
Analog output ( $V_{TX}$ ) offset voltage		-50		+50	mV

## RELAY DRIVER SCHEMATICS

**Notes:**

1. Unless otherwise specified, test conditions are  $V_{CC} = +5\text{ V}$ ,  $BAT1 = -50\text{ V}$ ,  $BAT2 = -34\text{ V}$ ,  $R_L = 600\ \Omega$ ,  $R_{DC1} = R_{DC2} = 5.833\text{ k}\Omega$ ,  $R_{TMG} = 570\ \Omega$ ,  $R_D = 35.4\text{ k}\Omega$ ,  $R_{FA} = 0\ \Omega$ , no fuse resistors,  $C_{HP} = 0.22\ \mu\text{F}$ ,  $C_{DC} = 0.5\ \mu\text{F}$ ,  $C_{CAS} = 0.33\ \mu\text{F}$ ,  $C_{VBAT12} = 220\text{ nF}$ ,  $D_1 = D_2 = 1\text{N}400\text{x}$ ,  $OVH = 1$ , two-wire AC input impedance is a  $600\ \Omega$  resistance synthesized by the programming network shown below.

2. a. Overload level exists when  $THD = 1\%$ .  
b. Overload level exists when  $THD = 1.5\%$ .
3. This parameter is tested at  $1\text{ kHz}$  in production. Performance at other frequencies is guaranteed by characterization.
4. Not tested in production. This parameter is guaranteed by characterization or correlation to other tests.
5. Tested with  $0\ \Omega$  source impedance.  $2\text{ M}\Omega$  is specified for system design only.
6. Group delay can be greatly reduced by using a  $Z_T$  network such as that shown in Note 1 above. The network reduces the group delay to less than  $2\ \mu\text{s}$  and increases  $2\text{WRL}$ . The effect of group delay on linecard performance also may be compensated for by synthesizing complex impedance with the  $DSLAC^{\text{TM}}$  or  $QSLAC^{\text{TM}}$  device.
7. Minimum current level is guaranteed not to cause a false Loop Detect. The SLIC must be functional in this condition.
8. Four-wire performance is  $5\text{--}9\text{ dB}$  better than the specified two-wire values.
9. Open loop, Active state, Metering mode power dissipation may be reduced from a typical of  $550\text{ mW}$  to a typical of  $150\text{ mW}$  by connecting the  $\overline{DET}$  pin to the  $OVH$  pin. This connection will force the SLIC into the nonmetering mode while on hook. With this connection, a metering signal sent after the SLIC goes on hook may be distorted on the  $2\text{W}$  line because the SLIC is forced into the nonmetering mode. To eliminate this distortion, a delay can be added between the time the SLIC goes on hook and the time the SLIC switches to nonmetering mode by using an RC circuit for the  $\overline{DET}$  pin to  $OVH$  pin connection.

Table 1. SLIC Decoding

State	C3 C2 C1	2-Wire Status	$\overline{\text{DET}}$ Output	
			E1 = 1	E1 = 0
0	0 0 0	Standby, Reverse Polarity	Loop detector	GK
1	0 0 1	Reserved	X	X
2	0 1 0	Active, Reverse Polarity	Loop detector	GK
3	0 1 1	Tip Open	GK or loop detector	GK
4	1 0 0	Disconnect	Ring trip	Ring trip
5	1 0 1	Ringing	Ring trip	Ring trip
6	1 1 0	Active, Normal	Loop detector	GK
7	1 1 1	Standby, Normal	Loop detector	GK

Table 2. User-Programmable Components

$Z_T = 253(Z_{2\text{WIN}} - 2R_F)$	<p><math>Z_T</math> is connected between the VTX and RSN pins. The fuse resistors are <math>R_F</math>, and <math>Z_{2\text{WIN}}</math> is the desired two-wire AC input impedance. When computing <math>Z_T</math>, the internal current amplifier pole and any external stray capacitance between VTX and RSN must be taken into account. The internal amplifier pole is:</p> $\frac{22 \text{ kHz} \cdot R_{\text{LAC}}}{600 \Omega \pm 10\%}$
$Z_{\text{RX}} = \frac{Z_L}{G_{42\text{L}}} \cdot \frac{500(Z_T)}{Z_T + 253(Z_L + 2R_F)}$	<p><math>Z_{\text{RX}}</math> is connected from VRX to RSN. <math>Z_T</math> is defined above, and <math>G_{42\text{L}}</math> is the desired receive gain. <math>Z_L</math> is the 2-wire load impedance.</p>
$I_{\text{LIMIT}} = \frac{625(\text{GFA})}{R_{\text{DC1}} + R_{\text{DC2}}}$ $C_{\text{DC}} = 1.5 \text{ ms} \cdot \frac{R_{\text{DC1}} + R_{\text{DC2}}}{R_{\text{DC1}} \cdot R_{\text{DC2}}}$ $\text{GFA} = 0.99 \cdot \frac{(R_{\text{FA}} + 30.1 \text{ k}\Omega)}{(R_{\text{FA}} + 32 \text{ k}\Omega)}$ $\text{RCL} = 1.4 \cdot (R_{\text{DC1}} + R_{\text{DC2}}) \cdot \frac{(R_{\text{FA}} + 60 \text{ k}\Omega)}{(R_{\text{FA}} + 100 \text{ k}\Omega)}$	<p><math>R_{\text{DC1}}</math>, <math>R_{\text{DC2}}</math>, and <math>C_{\text{DC}}</math> form the network connected to the <math>R_{\text{DC}}</math> pin. <math>R_{\text{DC1}}</math> and <math>R_{\text{DC2}}</math> are approximately equal. <math>I_{\text{LIMIT}}</math> is the desired loop current in the constant-current region.</p>
$R_D = \frac{365}{I_T}, \quad C_D = \frac{0.5 \text{ ms}}{R_D}$	<p><math>R_D</math> and <math>C_D</math> form the network connected from <math>R_D</math> to AGND/DGND and <math>I_T</math> is the threshold current between on hook and off hook in the Active state.</p>
$C_{\text{CAS}} = \frac{1}{3.4 \cdot 10^5 \pi f_c}$	<p><math>C_{\text{CAS}}</math> is the regulator filter capacitor and <math>f_c</math> is the desired filter cutoff frequency.</p>
$I_{\text{standby}} = \frac{ V_{\text{BAT1}}  - 3 \text{ V}}{400 \Omega + R_L}$	<p>Standby loop current (resistive region).</p>
$C_{\text{BSWEN}} = 5 \mu\text{hos} \cdot T_D(\text{ms})$	<p><math>C_{\text{BSWEN}}</math> is connected from BSWEN to GND for automatic switching. <math>T_D</math> is the delay in switching from BAT1 to BAT2. The delay from BAT2 to BAT1 is about 0.1 <math>T_D</math>.</p>

**Table 2. User-Programmable Components (continued)**

$R_{FEED} = 2 \cdot R_{FUSE} + \left( \frac{R_{DC1} + R_{DC2}}{GDC} \right)$ $GDC = 47.9 \left( \frac{40 \text{ k}\Omega + RFA}{120 \text{ k}\Omega + RFA} \right)$	<p>The DC feed resistance can be adjusted with a resistance (RFA) from the RFA pin to ground.</p>
<b>Thermal Management Equations (Active, Normal, and Reverse Polarity States)</b>	
$R_{TMG} \geq \frac{ V_{BAT2}  - 6 \text{ V}}{I_{LOOPmax}} \quad (OVH = 1)$ $R_{TMG} \geq \frac{ V_{BAT2}  - 7.5 \text{ V}}{I_{LOOPmax}} \quad (OVH = 0)$	<p><math>R_{TMG}</math> is connected from TMG to VBAT2 and is used to limit power dissipation within the SLIC in Active states only.</p>
$P_{RTMG} = \frac{( V_{BAT2}  - 6 \text{ V} - (I_L \cdot R_L))^2 (R_{TMG})}{(R_{TMG} + 40)^2}$ <p>(OVH = 1)</p> $P_{RTMG} = \frac{( V_{BAT2}  - 7.5 \text{ V} - (I_L \cdot R_L))^2 (R_{TMG})}{(R_{TMG} + 40)^2}$ <p>(OVH = 0)</p>	<p>Power dissipated in the thermal management resistor, <math>R_{TMG}</math>, during the Active states.</p>
$P_{SLIC} = ( V_{BAT2}  \cdot I_L) - P_{RTMG} - R_L \cdot (I_L)^2 + 0.22 \text{ W}$	<p>Power dissipated in the SLIC while in the Active states.</p>

**DC FEED CHARACTERISTICS**

$R_{DC} = R_{DC1} + R_{DC2} = 11.67 \text{ k}\Omega$ ,

$RFA = 0 \Omega$

No fuse resistors

OVH = 1

BAT1 = -50 V

**Notes:**

Graph is for illustration only.

1.  $V_{AB} = I_{LIMIT} \cdot RCL - I_L \cdot RCL$

2.  $V_{AB} = 52 \text{ V} - I_L \left( \frac{RDC}{GDC} \right)$

3a.  $V_{AB} = 0.8|V_{BAT1}| + 2.2 - I_L \left( \frac{RDC}{5 \cdot GDC} \right), OVH = 1$

3b.  $V_{AB} = 0.8|V_{BAT1}| - 1.0 - I_L \left( \frac{RDC}{5 \cdot GDC} \right), OVH = 0$

**a. Load Line (Typical)**

Feed current programmed by  $R_{DC1}$  and  $R_{DC2}$

**b. Feed Programming**

**PHYSICAL DIMENSIONS**

**32-Pin PLCC**

NOTES:

32-Pin PLCC			
JEDEC # MS-016			
Symbol	Min	Nom	Max
A	0.125	--	0.140
A1	0.075	0.090	0.095
D	0.485	0.490	0.495
D1	0.447	0.450	0.453
D2	0.205 REF		
E	0.585	0.590	0.595
E1	0.547	0.550	0.553
E2	0.255 REF		
θ	0 deg	--	10 deg

- 1 Dimensioning and tolerancing conform to ASME Y14,5M-1994.
- 2 To be measured at seating plan [-C-] contact point.
- 3 Dimensions "D1" and "E1" do not include mold protrusion. Allowable mold protrusion is 0.010 inch per side. Dimensions "D" and "E" include mold mismatch and determined at the parting line; that is "D1" and "E1" are measured at the extreme material condition at the upper or lower parting line.
- 4 Exact shape of this feature is optional.
- 5 Details of pin 1 identifier are optional but must be located within the zone indicated.
- 6 Sum of DAM bar protrusions to be 0.007 max per lead.
- 7 Controlling dimension : Inch.
- 8 Reference document : JEDEC MS-016

**32-Pin PLCC**

**Note:**

Packages may have mold tooling markings on the surface. These markings have no impact on the form, fit or function of the device. Markings will vary with the mold tool used in manufacturing.

---

**REVISION SUMMARY****Revision C to Revision D**

- In the Electrical Characteristics table on page 8, some information was changed in the Test Conditions column in the Loop Detector section and the "Loop-detect threshold hysteresis" row was added to this section.

**Revision D to Revision E**

- The physical dimensions (PL032) were added to the Physical Dimensions section.
- Updated the Pin Description table to correct inconsistencies.

**Revision E to Revision F**

- Updated OPN (Ordering Part Number) throughout document.
- Absolute Maximum Ratings: Notes updated to standard.
- Operating Ranges: Temperature statement updated to standard.
- Updated "Sales Office Listing."
- Updated physical dimension drawings.

**Revision F1 to G1**

- Removed non-green OPNs from Ordering Information.
- Removed all QFN package information throughout data sheet.
- In *Electrical Characteristics*, removed specifications for polarity grade options, 1 and 4 - 6

**Revision G1 to G2**

- Added notes to Ordering Information on page 2.

**Revision G2 to G3**

- Enhanced format of package drawing in *Physical Dimensions*
- Added new headers/footers due to Zarlink purchase of Legerity on August 3, 2007

**For more information about all Zarlink products  
visit our Web Site at  
[www.zarlink.com](http://www.zarlink.com)**

Information relating to products and services furnished herein by Zarlink Semiconductor Inc. or its subsidiaries (collectively "Zarlink") is believed to be reliable. However, Zarlink assumes no liability for errors that may appear in this publication, or for liability otherwise arising from the application or use of any such information, product or service or for any infringement of patents or other intellectual property rights owned by third parties which may result from such application or use. Neither the supply of such information or purchase of product or service conveys any license, either express or implied, under patents or other intellectual property rights owned by Zarlink or licensed from third parties by Zarlink, whatsoever. Purchasers of products are also hereby notified that the use of product in certain ways or in combination with Zarlink, or non-Zarlink furnished goods or services may infringe patents or other intellectual property rights owned by Zarlink.

This publication is issued to provide information only and (unless agreed by Zarlink in writing) may not be used, applied or reproduced for any purpose nor form part of any order or contract nor to be regarded as a representation relating to the products or services concerned. The products, their specifications, services and other information appearing in this publication are subject to change by Zarlink without notice. No warranty or guarantee express or implied is made regarding the capability, performance or suitability of any product or service. Information concerning possible methods of use is provided as a guide only and does not constitute any guarantee that such methods of use will be satisfactory in a specific piece of equipment. It is the user's responsibility to fully determine the performance and suitability of any equipment using such information and to ensure that any publication or data used is up to date and has not been superseded. Manufacturing does not necessarily include testing of all functions or parameters. These products are not suitable for use in any medical products whose failure to perform may result in significant injury or death to the user. All products and materials are sold and services provided subject to Zarlink's conditions of sale which are available on request.

Purchase of Zarlink's I<sup>2</sup>C components conveys a license under the Philips I<sup>2</sup>C Patent rights to use these components in an I<sup>2</sup>C System, provided that the system conforms to the I<sup>2</sup>C Standard Specification as defined by Philips.

Zarlink, ZL, the Zarlink Semiconductor logo and the Legerity logo and combinations thereof, VoiceEdge, VoicePort, SLAC, ISLIC, ISLAC and VoicePath are trademarks of Zarlink Semiconductor Inc.
