MUTE STAND-BY FUNCTION

The pin 5 (MUTE/STAND-BY) controls the amplifier status by two different thresholds, referred to +V_S.

- When V_{pin5} higher than = +V_S - 2.5V the amplifier is in Stand-by mode and the final stage generators are off
- when V_{pin5} is between +V_S - 2.5V and +V_S - 6V the final stage current generators are switched on and the amplifier is in mute mode
- when V_{pin5} is lower than +V_S - 6V the amplifier is play mode.

BRIDGE APPLICATION

Another application suggestion concerns the BRIDGE configuration, where the two power amplifiers are connected as shown by the schematic diagram of figure. 18.
This application shows, however, some operative limits due to dissipation and current capability of the output stage. For this reason, we reccomend to use the TDA7265 in bridge with the supply voltage equal/lower than ±16V when the load is 8Ω; with higher loads (i.e.16Ω), the amplifier can work correctly in the whole supply voltage range.

The detected characteristics of T.H.D. vs Pout and Frequency Response are shown in fig.19 and fig.20.
With R1=8Ω, Vs=+/-16V the maximum output power obtainable is 50W at T.D.H.=10%.
The quiescent current remains unchanged with respect to the stereo configuration (~80mA as typical at Vs=+/-16V).
The last point to take into consideration concerns the short-circuit protection. As for the stereo application, the TDA7265 is fully protected against any kind of short-circuit (between Out/Gnd, Out/+Vs and Out/-Vs).
