20W BRIDGE AMPLIFIER FOR CAR RADIO

High output power : $P_O = 10 + 10 W@R_L = 2\Omega$, $d = 10\%$; $P_O = 20W@R_L = 4\Omega$, $d = 1\%$.

High reliability of the chip and package with additional complete safety during operation thanks to protection against :

- OUTPUT DC AND AC SHORT CIRCUIT TO GROUND
- OVERRATING CHIP TEMPERATURE
- LOAD DUMP VOLTAGE SURGE
- FORTUITOUS OPEN GROUND
- VERY INDUCTIVE LOADS

Flexibility in use : bridge or stereo booster amplifiers with or without bootstrap and with programmable gain and bandwidth.

Space and cost saving : very low number of external components, very simple mounting system with no electrical isolation between the package and the heatsink (one screw only).

In addition, the circuit offers **loudspeaker protection** during short circuit for one wire to ground.

DESCRIPTION

The TDA2005 is class B dual audio power amplifier in MULTIWATT® package specifically designed for car radio application : **power booster amplifiers** are easily designed using this device that provides a high current capability (up to 3.5 A) and that can drive very low impedance loads (down to 1.6Ω in

Figure 3 : Output Offset Voltage versus Supply Voltage

Figure 4 : Distortion versus Output Power (bridge amplifier)

Figure 5 : Distortion versus Output Power (bridge amplifier)

BRIDGE AMPLIFIER DESIGN

The following considerations can be useful when designing a bridge amplifier.

Parameter		Single Ended	Bridge
$V_{o\ max}$	Peak Output Voltage (before clipping)	$\frac{1}{2} (V_s - 2 V_{CE\ sat})$	$V_s - 2 V_{CE\ sat}$
$I_{o\ max}$	Peak Output Current (before clipping)	$\frac{1}{2} \frac{V_s - 2 V_{CE\ sat}}{R_L}$	$\frac{V_s - 2 V_{CE\ sat}}{R_L}$
$P_{o\ max}$	RMS Output Power (before clipping)	$\frac{1}{4} \frac{(V_s - 2 V_{CE\ sat})^2}{2 R_L}$	$\frac{(V_s - 2 V_{CE\ sat})^2}{2 R_L}$

Where : $V_{CE\ sat}$ = output transistors saturation voltage
 V_s = allowable supply voltage
 R_L = load impedance

Voltage and current swings are twice for a bridge amplifier in comparison with single ended amplifier. In other words, with the same R_L the bridge configuration can deliver an output power that is four times the output power of a single ended amplifier, while, with the same max output current the bridge configuration can deliver an output power that is twice the output power of a single ended amplifier. Care must be taken when selecting V_S and R_L in order to avoid an output peak current above the absolute maximum rating.

From the expression for I_{Omax} , assuming $V_S = 14.4V$ and $V_{CEsat} = 2V$, the minimum load that can be driven by TDA2005 in bridge configuration is :

$$R_{Lmin} = \frac{V_S - 2 V_{CEsat}}{I_{Omax}} = \frac{14.4 - 4}{3.5} = 2.97\Omega$$

The voltage gain of the bridge configuration is given by (see Figure 34) :

$$G_v = \frac{V_0}{V_1} = 1 + \frac{R_1}{\left(\frac{R_2 \cdot R_4}{R_2 + R_4}\right)} + \frac{R_3}{R_4}$$

For sufficiently high gains (40 to 50dB) it is possible to put $R_2 = R_4$ and $R_3 = 2 R_1$, simplifying the formula in :

$$G_v = 4 \frac{R_1}{R_2}$$

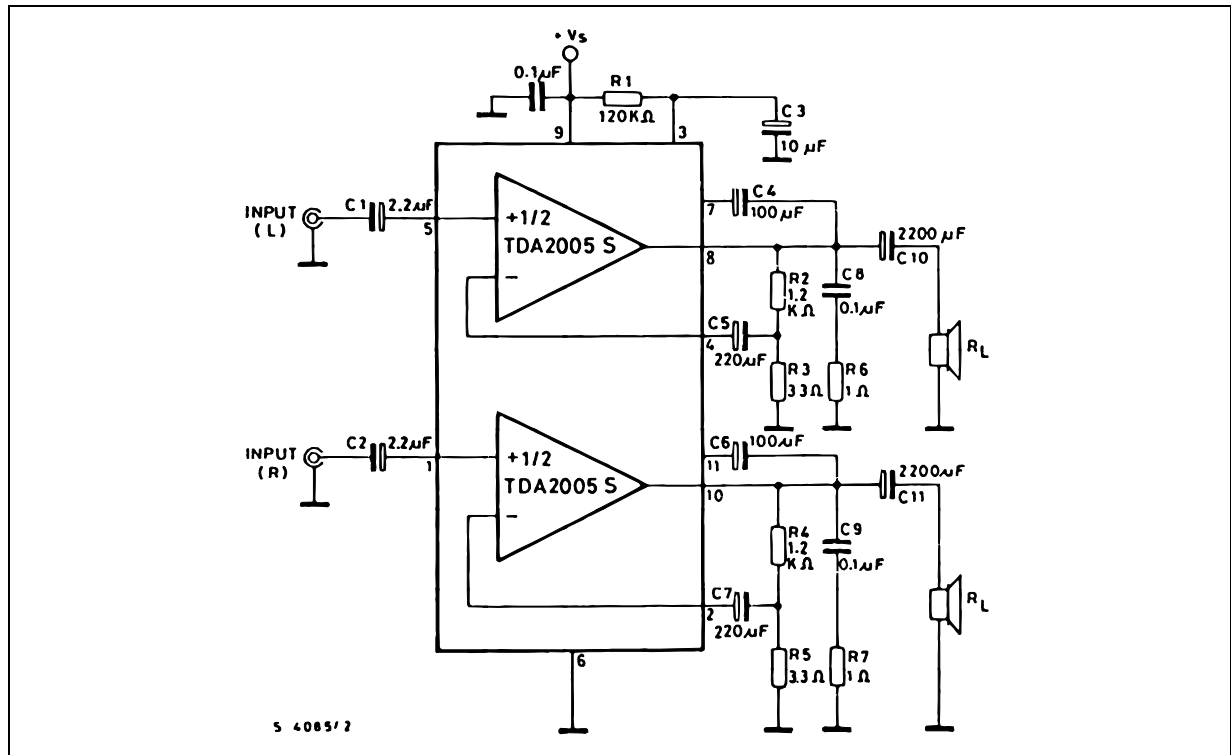

G_v (dB)	R_1 (Ω)	$R_2 = R_4$ (Ω)	R_3 (Ω)
40	1000	39	2000
50	1000	12	2000

APPLICATION SUGGESTION

The recommended values of the components are those shown on Bridge application circuit of Figure 1. Different values can be used ; the following table can help the designer.

Comp.	Recom. Value	Purpose	Larger Than	Smaller Than
R ₁	120 k Ω	Optimization of the Output Symmetry	Smaller P _{o max}	Smaller P _{o max}
R ₂	1k Ω			
R ₃	2 k Ω			
R ₄ , R ₅	12 Ω	Closed Loop Gain Setting (see Bridge Amplifier Design) (*)		
R ₆ , R ₇	1 Ω	Frequency Stability	Danger of Oscillation at High Frequency with Inductive Loads	
C ₁	2.2 μ F	Input DC Decoupling		
C ₂	2.2 μ F	Optimization of Turn on Pop and Turn on Delay	High Turn on Delay	Higher Turn on Pop, Higher Low Frequency Cut-off, Increase of Noise
C ₃	0.1 μ F	Supply by Pass		Danger of Oscillation
C ₄	10 μ F	Ripple Rejection	Increase of SVR, Increase of the Switch-on Time	Degradation of SVR.
C ₅ , C ₇	100 μ F	Bootstrapping		Increase of Distortion at low Frequency
C ₆ , C ₈	220 μ F	Feedback Input DC Decoupling, Low Frequency Cut-off		Higher Low Frequency Cut-off
C ₉ , C ₁₀	0.1 μ F	Frequency Stability		Danger of Oscillation

(*) The closed loop gain must be higher than 32dB.

BUILT-IN PROTECTION SYSTEMS

Load Dump Voltage Surge

The TDA2005 has a circuit which enables it to withstand a voltage pulse train, on Pin 9, of the type shown in Figure 34.

If the supply voltage peaks to more than 40V, then an LC filter must be inserted between the supply and pin 9, in order to assure that the pulses at pin 9 will be held within the limits shown.

A suggested LC network is shown in Figure 33. With this network, a train of pulses with amplitude up to 120V and width of 2ms can be applied at point A. This type of protection is ON when the supply voltage (pulse or DC) exceeds 18V. For this reason the maximum operating supply voltage is 18V.

Figure 33

Figure 34

Short Circuit (AC and DC conditions)

The TDA2005 can withstand a permanent short-circuit on the output for a supply voltage up to 16V.

Polarity Inversion

High current (up to 10A) can be handled by the device with no damage for a longer period than the blow-out time of a quick 2A fuse (normally connected in series with the supply). This feature is added to avoid destruction, if during fitting to the car, a mistake on the connection of the supply is made.

Open Ground

When the ratio is in the ON condition and the ground is accidentally opened, a standard audio amplifier will be damaged. On the TDA2005 protection diodes are included to avoid any damage.

Inductive Load

A protection diode is provided to allow use of the TDA2005 with inductive loads.

DC Voltage

The maximum operating DC voltage for the TDA2005 is 18V.

However the device can withstand a DC voltage up to 28V with no damage. This could occur during winter if two batteries are series connected to crank the engine.

Thermal Shut-down

The presence of a thermal limiting circuit offers the following advantages :

- 1) an overload on the output (even if it is permanent), or an excessive ambient temperature can be easily withstood.
- 2) the heatsink can have a smaller factor of safety compared with that of a conventional circuit.

There is no device damage in the case of excessive junction temperature : all that happens is that P_O (and therefore P_{tot}) and I_d are reduced.

The maximum allowable power dissipation depends upon the size of the external heatsink (i.e. its thermal resistance) ; Figure 35 shows the dissipable power as a function of ambient temperature for different thermal resistance.

Loudspeaker Protection

The circuit offers loudspeaker protection during short circuit for one wire to ground.
