## 10W CAR RADIO AUDIO AMPLIFIER

### DESCRIPTION

The TDA 2003 has improved performance with the same pin configuration as the TDA 2002.

The additional features of TDA 2002, very low number of external components, ease of assembly, space and cost saving, are maintained.

The device provides a high output current capability (up to 3.5A) very low harmonic and cross-over distortion.

Completely safe operation is guaranteed due to protection against DC and AC short circuit between all pins and ground, thermal over-range, load dump voltage surge up to 40V and fortuitous open ground.

**PENTAWATT**

**ORDERING NUMBERS :** TDA 2003H  
TDA 2003V

### ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
$V_S$	Peak supply voltage (50ms)	40	V
$V_S$	DC supply voltage	28	V
$V_S$	Operating supply voltage	18	V
$I_O$	Output peak current (repetitive)	3.5	A
$I_O$	Output peak current (non repetitive)	4.5	A
$P_{tot}$	Power dissipation at $T_{case} = 90^\circ C$	20	W
$T_{stg}, T_j$	Storage and junction temperature	-40 to 150	$^\circ C$

APPLICATION INFORMATION

Figure 16. Typical application circuit

Figure 17. P.C. board and component layout for the circuit of fig. 16 (1 : 1 scale)

BUILT-IN PROTECTION SYSTEMS

Load dump voltage surge

The TDA 2003 has a circuit which enables it to withstand a voltage pulse train, on pin 5, of the type shown in fig. 19.

If the supply voltage peaks to more than 40V, then an LC filter must be inserted between the supply and pin 5, in order to assure that the pulses at pin 5 will be held within the limits shown in fig. 18.

A suggested LC network is shown in fig. 19. With this network, a train of pulses with amplitude up to 120V and width of 2 ms can be applied at point A. This type of protection is ON when the supply voltage (pulsed or DC) exceeds 18V. For this reason the maximum operating supply voltage is 18V.

Figure 18.

Figure 19.

**Short-circuit (AC and DC conditions)**

The TDA 2003 can withstand a permanent short-circuit on the output for a supply voltage up to 16V.

**Polarity inversion**

High current (up to 5A) can be handled by the device with no damage for a longer period than the blow-out time of a quick 1A fuse (normally connected in series with the supply).

This feature is added to avoid destruction if, during fitting to the car, a mistake on the connection of the supply is made.

**Open ground**

When the radio is in the ON condition and the ground is accidentally opened, a standard audio amplifier will be damaged. On the TDA 2003 protection diodes are included to avoid any damage.

**Inductive load**

A protection diode is provided between pin 4 and 5 (see the internal schematic diagram) to allow use of the TDA 2003 with inductive loads.

In particular, the TDA 2003 can drive a coupling transformer for audio modulation.

**DC voltage**

The maximum operating DC voltage on the TDA 2003 is 18V.

However the device can withstand a DC voltage up to 28V with no damage. This could occur during winter if two batteries were series connected to crank the engine.

**Thermal shut-down**

The presence of a thermal limiting circuit offers the following advantages:

- 1) an overload on the output (even if it is permanent), or an excessive ambient temperature can be easily withstood.
- 2) the heat-sink can have a smaller factor compared with that of a conventional circuit. There is no device damage in the case of excessive junction temperature: all that happens is that  $P_o$  (and therefore  $P_{tot}$ ) and  $I_d$  are reduced.

Figure 20. Output power and drain current vs. case temperature ( $R_L = 4\Omega$ )

Figure 21. Output power and drain current vs. case temperature ( $R_L = 2\Omega$ )

**PRATICAL CONSIDERATION****Printed circuit board**

The layout shown in fig. 17 is recommended. If different layouts are used, the ground points of input 1 and input 2 must be well decoupled from the ground of the output through which a rather high current flows.

**Assembly suggestion**

No electrical insulation is required between the

package and the heat-sink. Pin length should be as short as possible. The soldering temperature must not exceed 260°C for 12 seconds.

**Application suggestions**

The recommended component values are those shown in the application circuits of fig. 16. Different values can be used. The following table is intended to aid the car-radio designer.

Component	Recommended value	Purpose	Larger than recommended value	Smaller than recommended value C1
C1	2.2 $\mu$ F	Input DC decoupling		Noise at switch-on, switch-off
C2	470 $\mu$ F	Ripple rejection		Degradation of SVR
C3	0.1 $\mu$ F	Supply bypassing		Danger of oscillation
C4	1000 $\mu$ F	Output coupling to load		Higher low frequency cutoff
C5	0.1 $\mu$ F	Frequency stability		Danger of oscillation at high frequencies with inductive loads
C <sub>x</sub>	$\cong \frac{1}{2\pi B R1}$	Upper frequency cutoff	Lower bandwidth	Larger bandwidth
R1	$(G_v - 1) \bullet R2$	Setting of gain		Increase of drain current
R2	2.2 $\Omega$	Setting of gain and SVR	Degradation of SVR	
R3	1 $\Omega$	Frequency stability	Danger of oscillation at high frequencies with inductive loads	
R <sub>x</sub>	$\cong 20 R2$	Upper frequency cutoff	Poor high frequency attenuation	Danger of oscillation
