Octal D-Type Latch with 3-State Output

The TC74LVX573F/ FW/ FT is a high-speed CMOS octal latch with 3-state output fabricated with silicon gate CMOS technology. Designed for use in 3-V systems, it achieves high-speed operation while maintaining the CMOS low power dissipation.

This device is suitable for low-voltage and battery operated systems.

This 8 bit D-type latch is controlled by a latch enable input (LE) and a output enable input ($\overline{OE}$). When the $\overline{OE}$ input is high, the eight outputs are in a high-impedance state.

An input protection circuit ensures that 0 to 5.5V can be applied to the input pins without regard to the supply voltage. This device can be used to interface 5V to 3V systems and two supply systems such as battery back up. This circuit prevents device destruction due to mismatched supply and input voltages.

Features

- High speed: t_{pd} = 6.4 ns (typ.) (V_{CC} = 3.3 V)
- Low-power dissipation: I_{CC} = 4 μA (max) (Ta = 25°C)
- Input voltage level: V_{IL} = 0.8 V (max) (V_{CC} = 3 V)
  V_{IH} = 2.0 V (min) (V_{CC} = 3 V)
- Power-down protection provided on all inputs
- Balanced propagation delays: $t_{pLH} \simeq t_{pHL}$
- Low noise: V_{OLP} = 0.8 V (max)
- Pin and function compatible with 74HC573

Note: xxxFW (JEDEC SOP) is not available in Japan.

Note 3: C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption.
Average operating current can be obtained by the equation:
$I_{CC\ (opr)} = C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC}/8$ (per latch)
And the total C_{PD} when n pcs. of Latch operate can be gained by the following equation:
C_{PD} (total) = 21 + 8·n
