Features

- Processed with HVCMOS[®] technology
- Sink current minimum 100mA
- Shift register speed 8MHz
- Polarity and Blanking inputs
- CMOS compatible inputs
- Forward and reverse shifting options
- Diode to V_{PP} allows efficient power recovery
- 44-lead ceramic surface mount package
- Hi-Rel processing available

General Description

The HV55 and HV56 are low-voltage serial to high-voltage parallel converters with open drain outputs. These devices have been designed for use as drivers for AC-electroluminescent displays. They can also be used in any application requiring multiple output high voltage current sinking capabilities such as driving inkjet and electrostatic print heads, plasma panels, vacuum fluorescent, or large matrix LCD displays.

These devices consist of a 32-bit shift register, 32 latches, and control logic to perform the polarity select and blanking of the outputs. Data is shifted through the shift register on the high to low transition of the clock. The HV55 shifts in the counterclockwise direction when viewed from the top of the package, and the HV56 shifts in the clockwise direction. A data output buffer is provided for cascading devices. This output reflects the current status of the last bit of the shift register. Operation of the shift register is not affected by the \overline{LE} (latch enable), \overline{BL} (blanking), or the \overline{POL} (polarity) inputs. Transfer of data from the shift register to the latch occurs when the \overline{LE} (latch enable) input is high. The data in the latch is stored when \overline{LE} is low.

Note:

Power-up sequence should be the following:

1. Connect ground.
2. Apply V_{DD} .
3. Set all inputs to a known state.

Power-down sequence should be the reverse of the above.
