## Low Voltage Universal 16-bit IEEE 1149.1 Bus Transceiver with TRI-STATE Outputs

### General Description

The SCAN16512 is a high speed, low-power universal bus transceiver featuring data inputs organized into two 8-bit bytes with output enable and latch enable control signals. This function is configurable as a D-type Latch or Flip-Flop, and can operate in transparent, latched, or clocked mode. This device is compliant with IEEE 1149.1 Standard Test Access Port and Boundary Scan Architecture with the incorporation of the defined boundary-scan test logic and test access port consisting of Test Data Input (TDI), Test Data Out (TDO), Test Mode Select (TMS), Test Clock (TCK), and Test Reset (TRST).

### Features

- IEEE 1149.1 (JTAG) Compliant
- 2.7V to 3.6V  $V_{CC}$  Operation
- TRI-STATE outputs for bus-oriented applications
- Dual byte-wide data for bus applications
- Power down high Impedance inputs and outputs
- Optional Bus Hold on data inputs eliminates the need for external pullup/pulldown resistors (SCANH16512, SCANH162512 versions)
- Optional  $25\Omega$  series resistors in outputs to minimize noise and eliminate termination resistors (SCAN162512, SCANH162512 versions)
- Supports live insertion/withdrawal
- Includes CLAMP and HIGHZ instructions

TDO	The Test Data Output to support IEEE Std 1149.1-1990. TDO is the serial output for shifting data through the instruction register or selected data register.
TMS	The Test Mode Select input to support IEEE Std 1149.1-1990. TMS directs the device through its TAP controller states. An internal pull-up forces TMS high if left unconnected.
TCK	The Test Clock input to support IEEE Std 1149.1-1990. Test operations of the device are synchronous to TCK. Data is captured on the rising edge of TCK and outputs change on the falling edge of TCK.
TDI	The Test Data Input to support IEEE Std 1149.1-1990. TDI is the serial input to shift data through the instruction register or the selected data register. An internal pull-up resistor forces TDI high if left unconnected.
$\overline{\text{TRST}}$	The Test Reset Input to support IEEE Std 1149.1-1990. TRST is the asynchronous reset pin which will force the TAP controller to its initialization state when active. An internal pullup resistor forces $\overline{\text{TRST}}$ high if left unconnected.

**Note 2:** Output level before the indicated steady-state input conditions were established.

## Functional Description

In the normal mode, these devices are 16-bit universal bus transceivers that combine D-type latches and D-type flip-flops to allow data flow in transparent, latched, or clocked modes. They can be used as two 8-bit transceivers, or as one 16-bit transceiver. The test circuitry can be activated by the TAP to take snapshot samples of the data appearing at the device pins or to perform a self test on the boundary-test cells. Activating the TAP may affect the normal functional operation of the universal bus transceivers. When the TAP is activated, the test circuitry performs boundary-scan test operations according to the protocol described in IEEE Std 1149.1-1990.

Data flow in each direction is controlled by output-enable ( $\overline{OEAB}$  and  $\overline{OEBA}$ ), latch-enable (LEAB and LEBA), and clock (CLKAB and CLKBA) inputs. For A-to-B data flow, the

devices operate in the transparent mode when LEAB is high. When LEAB is low, the A data is latched while CLKAB is held at a static low or high logic level. Otherwise, if LEAB is low, A data is stored on a low-to-high transition of CLKAB. When  $\overline{OEAB}$  is LOW, the B outputs are active. When  $\overline{OEAB}$  is HIGH, the B outputs are in the high-impedance state. B-to-A data flow is similar to A-to-B data flow but uses the  $\overline{OEBA}$ , LEBA, and CLKBA inputs.

Five dedicated test pins are used to observe and control the operation of the test circuitry: test data input (TDI), test data output (TDO), test mode select (TMS), test clock (TCK), and test reset ( $\overline{TRST}$ ). All testing and scan operations are synchronized to the TAP interface.

For details about the sequence of boundary scan cells in the SCAN16512, please refer to the BSDL (Boundary Scan Description Language) file available on our website.
