### Features

Type	$R_{DS(on)}$	$I_{OUT}$	$V_{CC}$
VN800S VN800PT	135 m $\Omega$	0.7 A	36 V

- CMOS-compatible input
- Thermal shutdown
- Current limitation
- Shorted load protection
- Under-voltage and over-voltage shutdown
- Protection against loss of ground
- Very low standby current
- Reverse battery protected (see [Application schematic](#))

### Description

The VN800S and VN800PT are monolithic devices designed in STMicroelectronics VIPower M0-3 technology. The VN800S and VN800PT are intended for driving any type of load with one side connected to ground. The active  $V_{CC}$  pin voltage clamp protects the device against low energy spikes (see ISO7637 transient compatibility table).

Active current limitation combined with thermal shutdown and automatic restart protects the device against overload. The device automatically turns off in the case where the ground pin becomes disconnected.

This device is especially suitable for industrial applications in norms conformity with IEC1131 (programmable controllers international standard).

### 2.1 Absolute maximum ratings

Stressing the device above the rating listed in the “Absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to Absolute maximum rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics sure program and other relevant quality document.

Table 3. Absolute maximum ratings

Symbol	Parameter	Value		Unit
		SO-8	PPAK	
$V_{CC}$	DC supply voltage	41		V

$V_F$	Forward on voltage	- $I_{OUT} = 0.6A$ ; $T_j = 150^\circ C$			0.7	V

**Table 9. Status pin**

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
$V_{STAT}$	Status low output voltage	$I_{STAT} = 1.6mA$			0.5	V
$I_{LSTAT}$	Status leakage current	Normal operation; $V_{STAT} = V_{CC} = 36V$			10	$\mu A$
$C_{STAT}$	Status pin input capacitance	Normal operation; $V_{STAT} = 5V$			30	pF

**Table 10. Protections<sup>(1)</sup>**

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
$T_{TSD}$	Shutdown temperature		150	175	200	$^\circ C$
$T_R$	Reset temperature		135			$^\circ C$
$T_{hyst}$	Thermal hysteresis		7	15		$^\circ C$
$t_{SDL}$	Status delay in overload condition	$T_j > T_{jsh}$			20	$\mu s$
$I_{lim}$	Current limitation	$V_{CC} = 24V$ $R_{LOAD} = 10m\Omega$	0.7		2	A
$V_{demag}$	Turn-off output clamp voltage	$I_{OUT} = 0.5A$ ; $L = 6mH$	$V_{CC} - 47$	$V_{CC} - 52$	$V_{CC} - 57$	V

1. To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device operates under abnormal conditions this software must limit the duration and number of activation cycles.

### 3 Application information

Figure 21. Application schematic

#### 3.1 GND protection network against reverse battery

##### 3.1.1 Solution 1: resistor in the ground line ( $R_{GND}$ only)

This can be used with any type of load.

The following is an indication on how to dimension the  $R_{GND}$  resistor.

1.  $R_{GND} \leq 600\text{mV} / (I_{S(on)max})$ .
2.  $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where  $-I_{GND}$  is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

Power Dissipation in  $R_{GND}$  (when  $V_{CC} < 0$ : during reverse battery situations) is:

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSDs. Please note that the value of this resistor should be calculated with formula (1) where  $I_{S(on)max}$  becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not shared by the device ground then the  $R_{GND}$  will produce a shift ( $I_{S(on)max} * R_{GND}$ ) in the input thresholds and the status output values. This shift will vary depending on how many devices are ON in the case of several high-side drivers sharing the same  $R_{GND}$ .

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then ST suggests to utilize Solution 2 (see below).

### 3.1.2 Solution 2: diode ( $D_{GND}$ ) in the ground line

A resistor ( $R_{GND} = 1k\Omega$ ) should be inserted in parallel to  $D_{GND}$  if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network will produce a shift ( $\approx 600mV$ ) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift will not vary if more than one HSD shares the same diode/resistor network.

Series resistor in INPUT and STATUS lines are also required to prevent that, during battery voltage transient, the current exceeds the absolute maximum rating.

Safest configuration for unused INPUT and STATUS pin is to leave them unconnected.

## 3.2 MCU I/Os protection

If a ground protection network is used and negative transient are present on the  $V_{CC}$  line, the control pins will be pulled negative. ST suggests to insert a resistor ( $R_{prot}$ ) in line to prevent the  $\mu C$  I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of  $\mu C$  and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of  $\mu C$  I/Os.

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For  $V_{CCpeak} = -100V$  and  $I_{latchup} \geq 20mA$ ;  $V_{OH\mu C} \geq 4.5V$

$$5k\Omega \leq R_{prot} \leq 65k\Omega$$

Recommended values:  $R_{prot} = 10k\Omega$ .

### 3.3 SO-8 maximum demagnetization energy ( $V_{CC} = 13.5V$ )

Figure 22. SO-8 maximum turn-off current versus inductance

Note: Values are generated with  $R_L = 0 \Omega$ . In case of repetitive pulses,  $T_{jstart}$  (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

### 3.4 PPAK maximum demagnetization energy ( $V_{CC} = 13.5V$ )

Figure 23. PPAK maximum turn-off current versus inductance

Note: Values are generated with  $R_L = 0 \Omega$ . In case of repetitive pulses,  $T_{jstart}$  (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

## 4 Package and PCB thermal data
