Smart Highside Power Switch

Product Summary

Overvoltage protection	$V_{bb(AZ)}$	65	V
Operating voltage	$V_{bb(on)}$	5.8 ... 58	V
On-state resistance	R_{ON}	250	mΩ
Load current (ISO)	$I_{L(ISO)}$	1.7	A

Features

- Overload protection
- Current limitation
- Short circuit protection
- Thermal shutdown
- Overvoltage protection
- Fast demagnetization of inductive loads
- Reverse battery protection[1]
- Open drain diagnostic output
- Open load detection in OFF-state
- CMOS compatible input
- Loss of ground and loss of V_{bb} protection
- **E**lectro**s**tatic **d**ischarge (**ESD**) protection

TO-220AB/5

Standard   Straight leads   SMD

Application

- μC compatible power switch with diagnostic feedback for 12 V and 24 V DC grounded loads
- Most suitable for inductive loads
- Replaces electromechanical relays, fuses and discrete circuits

General Description

N channel vertical power FET with charge pump, ground referenced CMOS compatible input and diagnostic feedback, monolithically integrated in Smart SIPMOS® technology. Providing embedded protective functions.

---
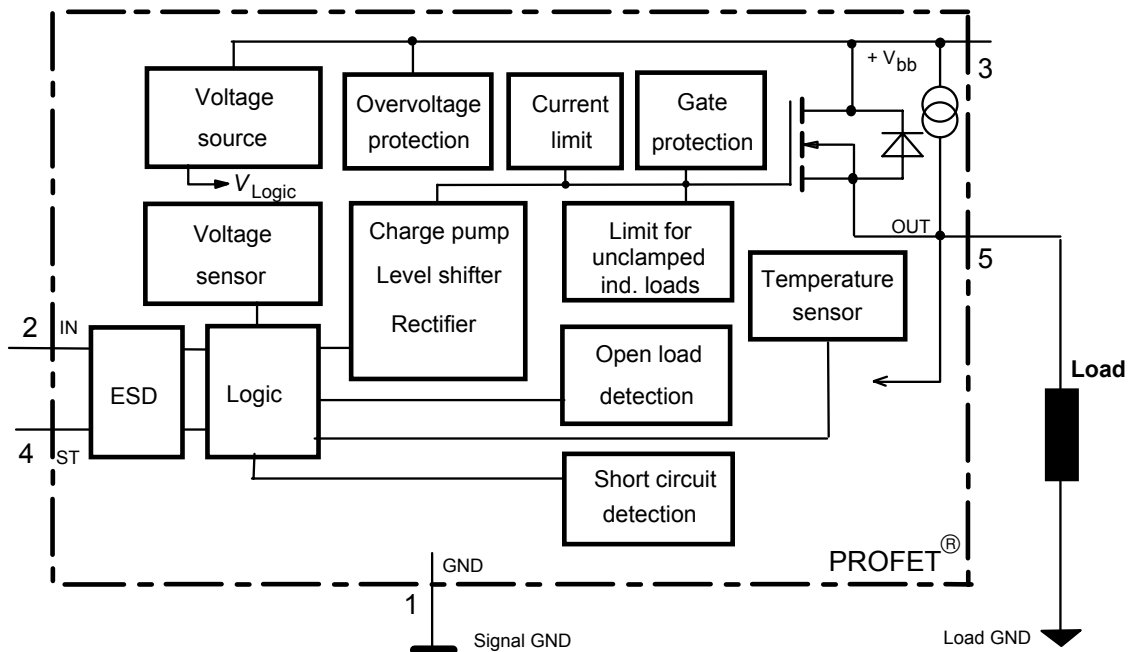

[1] With external current limit (e.g. resistor R_{GND}=150 Ω) in GND connection, resistor in series with ST connection, reverse load current limited by connected load.

Pin	Symbol		Function
1	GND	-	Logic ground
2	IN	I	Input, activates the power switch in case of logical high signal
3	Vbb	+	Positive power supply voltage, the tab is shorted to this pin
4	ST	S	Diagnostic feedback
5	OUT (Load, L)	O	Output to the load

Maximum Ratings at T_j = 25 °C unless otherwise specified

Parameter	Symbol	Values	Unit
Supply voltage (overvoltage protection see page 3)	V_{bb}	65	V
Supply voltage for full short circuit protection[2] $T_{j\ Start}$=-40 ...+150°C	V_{bb}	40	V
Load current (Short circuit current, see page 4)	I_L	self-limited	A
Operating temperature range	T_j	-40 ...+150	°C
Storage temperature range	T_{stg}	-55 ...+150	
Power dissipation (DC), $T_C \leq 25$ °C	P_{tot}	50	W
Electrostatic discharge capability (ESD) (Human Body Model) IN, ST: all other pins:	V_{ESD}	1.0 tbd (>1.0)	kV
Input voltage (DC)	V_{IN}	-0.5 ... +36	V
Current through input pin (DC)	I_{IN}	±2.0	mA
Current through status pin (DC) see internal circuit diagrams page 5	I_{ST}	±5.0	

Thermal Characteristics

Parameter and Conditions	Symbol	Values			Unit
		min	typ	max	
Thermal resistance chip - case:	R_{thJC}	--	--	2.5	K/W
junction - ambient (free air):	R_{thJA}	--	--	75	

---

[2]   Status fault signal in case of short to GND. Internal thermal shutdown after several milliseconds. External shutdown in response to the status fault signal in less than about 1 ms necessary, if the device is used with higher V_{bb}.

Electrical Characteristics

Parameter and Conditions	Symbol	Values			Unit
at T_j = 25 °C, V_{bb} = 12 V unless otherwise specified		min	typ	max	

Load Switching Capabilities and Characteristics

Parameter and Conditions	Symbol	min	typ	max	Unit
On-state resistance (pin 3 to 5)	R_{ON}	--	220	250	mΩ
I_L = 2 A, V_{bb} = 24 V T_j=25 °C:					
T_j=150 °C:			390	500	
Nominal load current, ISO Norm (pin 3 to 5) V_{ON} = 0.5 V, T_C = 85 °C	$I_{L(ISO)}$	1.4	1.7 --		A
Output current (pin 5) while GND disconnected or GND pulled up, V_{bb}=32 V, V_{IN}= 0, see diagram page 6	$I_{L(GNDhigh)}$	--	--	1.1	mA
Turn-on time to 90% V_{OUT}:	t_{on}	15	--	80	µs
Turn-off time to 10% V_{OUT}: R_L = 12 Ω, V_{bb} = 20V, T_j =-40...+150°C	t_{off}	20	--	70	
Slew rate on, 10 to 30% V_{OUT}, R_L = 12 Ω, V_{bb} = 20V, T_j =-40...+150°C	dV/dt$_{on}$	--	--	6	V/µs
Slew rate off, 10 to 30% V_{OUT}, R_L = 12 Ω, V_{bb} = 20V, T_j =-40...+150°C	-dV/dt$_{off}$	--	--	7	V/µs

Operating Parameters

Parameter and Conditions	Symbol	min	typ	max	Unit
Operating voltage [3] T_j =-40...+150°C:	$V_{bb(on)}$	5.8	--	58	V
Undervoltage shutdown T_j =-40...+150°C:	$V_{bb(under)}$	2.7	--	4.7	V
Undervoltage restart T_j =-40...+150°C:	$V_{bb(u\,rst)}$	--	--	4.9	V
Undervoltage restart of charge pump see diagram page 10 T_j =-40...+150°C:	$V_{bb(ucp)}$	--	5.6	7.5	V
Undervoltage hysteresis $\Delta V_{bb(under)}$ = $V_{bb(u\,rst)}$ - $V_{bb(under)}$	$\Delta V_{bb(under)}$	--	0.4	--	V
Overvoltage protection [4] T_j =-40...+150°C: I_{bb}=40 mA	$V_{bb(AZ)}$	65	70	--	V
Standby current (pin 3), V_{IN}=0 T_j=-40...+150°C:	$I_{bb(off)}$	--	10	50	µA
Operating current (Pin 1) [5], V_{IN}=5 V	I_{GND}	--	2.2	--	mA

[3]   At supply voltage increase up to V_{bb}= 5.6 V typ without charge pump, $V_{OUT} \approx V_{bb}$ - 2 V
[4]   See also $V_{ON(CL)}$ in table of protection functions and circuit diagram page 6.
[5]   Add I_{ST}, if I_{ST} > 0, add I_{IN}, if V_{IN}>5.5 V

Parameter and Conditions	Symbol	Values			Unit

Delay time for status with open load after Input neg. slope (see diagram page 10)	$t_{d(ST\ OL3)}$	--	200	--	µs
Status output (open drain)					
Zener limit voltage T_j =-40...+150°C, I_{ST} = +1.6 mA:	$V_{ST(high)}$	5.4	6.1	--	V
ST low voltage T_j =-40...+150°C, I_{ST} = +1.6 mA:	$V_{ST(low)}$	--	--	0.4	

[6]   Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

[7]   Requires 150 Ω resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 2 and circuit page 6).
[8]   If a ground resistor R_{GND} is used, add the voltage drop across this resistor.

Truth Table

	Input-	Output	Status
	level	level	BTS 307 BTS 707
Normal operation	L H	L H	L H
Open load	L H	[9)] H	H H
Short circuit to GND	L H	L L	L L
Short circuit to V$_{bb}$	L H	H H	H H
Overtemperature	L H	L L	L L
Undervoltage	L H	L L	L L
Overvoltage	no overvoltage shutdown, see normal operation		

L = "Low" Level   X = don't care   Z = high impedance, potential depends on external circuit
H = "High" Level   Status signal after the time delay shown in the diagrams (see fig 5. page 10)

Terms

Status output

ESD-Zener diode: 6.1 V typ., max 5 mA;
$R_{ST(ON)}$ < 0 Ω at 1.6 mA, ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

Input circuit (ESD protection)

ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

Short circuit detection

Fault Signal at ST-Pin: V_{ON} > 2.5 V typ, no switch off by the PROFET itself, external switch off recommended!

---
9)   Power Transistor off, high impedance, internal pull up current source for open load detection.

Inductive and overvoltage output clamp
V_{ON} clamped to -- V typ.
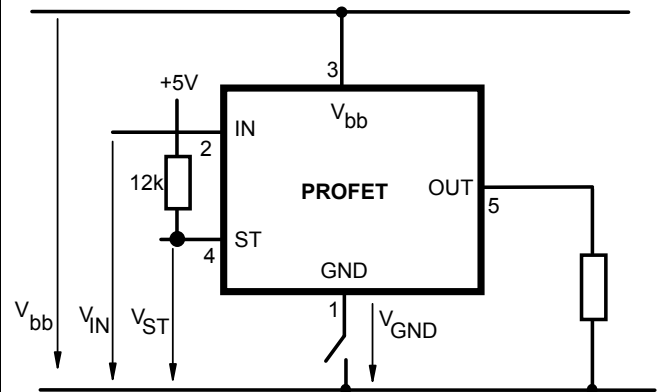

Overvolt. and reverse batt. protection

V_{Z1} = 6.2 V typ., V_{Z2} = 70 V typ., R_{GND} = 150 Ω, R_{ST}= 15 kΩ, R_I= 20 kΩ typ.

Open-load detection

OFF-state diagnostic condition: V_{OUT} > 3 V typ.; IN low

GND disconnect

For V_{bb}=24V and V_{IN}=0V: V_{ST}>2.8V @ $I_{ST} \geq 0$ if pulled up as shown.
Any kind of load. In case of Input=high is $V_{OUT} \approx V_{IN} - V_{IN(T+)}$.
GND disconnect with GND pull up

Any kind of load. If $V_{GND} > V_{IN} - V_{IN(T+)}$ device stays off
Due to V_{GND} >0, no V_{ST} = low signal available.

## V$_{bb}$ disconnect with energized inductive load

Normal load current can be handled by the PROFET itself.

Vbb disconnect with charged external inductive load

If other external inductive loads L are connected to the PROFET, additional elements like D are necessary.

Inductive Load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = {}^1/_2 \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t)\, dt,$$

with an approximate solution for $R_L > 0\,\Omega$:

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} \cdot \left(V_{bb} + |V_{OUT(CL)}|\right) \cdot ln\left(1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|}\right)$$

Options Overview

all versions: High-side switch, Input protection, ESD protectionand reverse battery protection with 150 Ω in GND connection, protection against loss of ground

| Type BTS	410D2	410E2	410G2	410H2	**307**	308

[10] Latch except when V_{bb} - V_{OUT} < $V_{ON(SC)}$ after shutdown. In most cases V_{OUT} = 0 V after shutdown ($V_{OUT} \neq$ 0 V only if forced externally). So the device remains latched unless V_{bb} < $V_{ON(SC)}$ (see page 4). No latch between turn on and $t_{d(SC)}$.

[11] With latch function. Reseted by a) Input low, b) Undervoltage, c) Overvoltage

[12] Low resistance short V_{bb} to output may be detected in ON-state by the no-load-detection

Timing diagrams

Figure 1a: V_{bb} turn on, :
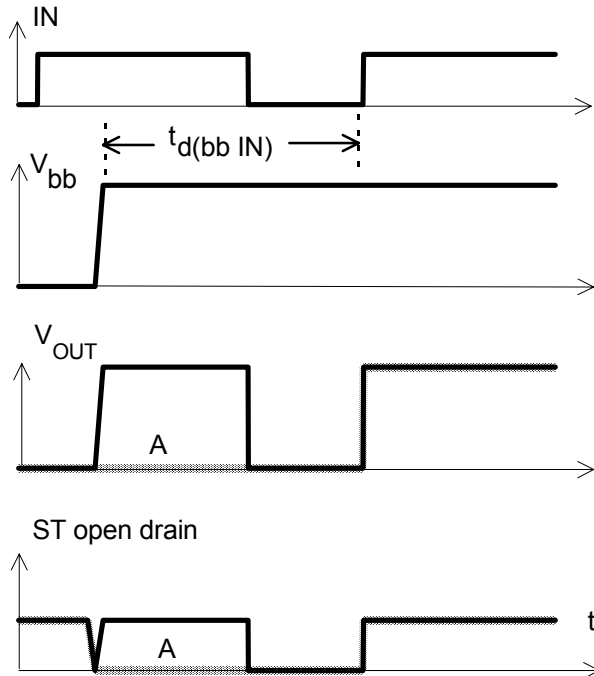

in case of too early V_{IN}=high the device may not turn on (curve A)
$t_{d(bb\ IN)}$ approx. 150 µs

**Figure 2a:** Switching an inductive load,

Figure 3a: Short circuit:
shut down by overtempertature, reset by cooling

Heating up requires several milliseconds, depending on external conditions. External shutdown in response to status fault signal recommended.
Figure 4a: Overtemperature:
Reset if $T_j < T_{jt}$

Figure 5a: Open load, : detection in OFF-state, turn on/off to open load

$t_{d(ST,OL3)}$ depends on external circuitry because of high impedance

*) I_L = 6 µA typ

Figure 5b: Open load, : detection in OFF-state, open load occurs in off-state

*) I_L = 6 µA typ

Figure 6a: Undervoltage:

**Figure 6b:** Undervoltage restart of charge pump

charge pump starts at $V_{bb(ucp)}$ =5.6 V typ.

Figure 7a: Overvoltage, no shutdown:
