## RF (Radio Frequency) Type [1-Channel (Form A) Type] —Low On resistance—

# PhotoMOS RELAYS

### FEATURES

**1. PhotoMOS relay with high response speed, low leakage current and low On resistance**

**2. Low capacitance between output terminals ensures high response speed:**

The capacitance between output terminals is small, typically 10 pF. This enables for a fast operation speed of 200 µs.

**3. High sensitivity and low On resistance**

Maximum 0.3 A of load current can be controlled with input current of 5 mA. The 10 Ω (AQV225N) On resistance is less than our conventional models. With no metallic contacts, the PhotoMOS relay has stable switching characteristics.

**4. Low-level off state leakage current**

The SSR has an off state leakage current of several milliamperes, whereas the PhotoMOS relay has only 30 pA even with the rated load voltage of 80 V (AQV225N).

**5. Controls low-level analog signals**

PhotoMOS relay features extremely low closed-circuit offset voltages to enable control of small analog signals without distortion.

**6. Low terminals electromotive force (approx. 1 µV)**

### TYPICAL APPLICATIONS

- Measuring devices
- Scanner, IC checker, Board tester
