11. NOTES

1 . HANDLING

(ELECTROSTATIC DISCHARGES)

This device is made with CMOS circuitry. Please take precautions to prevent damage due to electrical static discharge.

(SHOCK RELIABILITY)

This device contains a quartz crystal, so please do not give too much shock or vibration. An automatic inserion is available, however, the internal quartz crystal might be damaged in case that too much shock or vibration is given by machine condition. Be sure to check your machine condition in advance.

(CLEANING)

Since, depending on the cleaning conditions, there is a possibility of damage being caused to the Crystal Osillator, do not fail to test and confirm the results beforehand, using your company's cleaning conditions.

(TEMPERATURE AND HUMIDITY)

We recomend to store and use device under normal temperature and humidity. When this device is used in high humidity applications, there is a potential problem with condensation. As with other IC's, please take precautions to prevent condensation.

2 . CIRCUIT DESIGNS

(POWER LINES)

We recomend placing a 0.01 to 0.1 μ F capacitor between V_{DD} and GND to obtain stable operation and protect against power line ripple .
 V_{DD} and GND pattern should be as wide as possible.

(OE INPUT LINE)

When OE pin is not used, please connect it to V_{DD} .

(OUTPUT LINE)

As a long output line may cause irregular output, please take care to design that output line is as short as possible, and also keep high level signal source away from this device.
