Thunderbolt/HS™

APT30GS60KR(G)

600V, 30A, $V_{CE(ON)}$ = 2.8V Typical

Thunderbolt® High Speed NPT IGBT

The Thunderbolt HS™ series is based on thin wafer non-punch through (NPT) technology similar to the Thunderbolt® series, but trades higher $V_{CE(ON)}$ for significantly lower turn-on energy E_{off}. The low switching losses enable operation at switching frequencies over 100kHz, approaching power MOSFET performance but lower cost.

An extremely tight parameter distribution combined with a positive $V_{CE(ON)}$ temperature coefficient make it easy to parallel Thunderbolts HS™ IGBT's. Controlled slew rates result in very good noise and oscillation immunity and low EMI. The short circuit duration rating of 10μs make these IGBT's suitable for motor drive and inverter applications. Reliability is further enhanced by avalanche energy ruggedness.

FOOT NOTE:

① Repetitive Rating: Pulse width and case temperature limited by maximum junction temperature.
② Starting at $T_J = 25°C$, L = 224µH, $R_G = 25\Omega$, $I_C = 30A$
③ Short circuit time: $V_{GE} = 15V$, $V_{CC} \leq 600V$, $T_J \leq 150°C$
④ Pulse test: Pulse width < 380µs, duty cycle < 2%
⑤ $C_{o(cr)}$ is defined as a fixed capacitance with the same stored charge as C_{oes} with V_{CE} = 67% of $V_{(BR)CES}$.
⑥ $C_{o(er)}$ is defined as a fixed capacitance with the same stored energy as C_{oes} with V_{CE} = 67% of $V_{(BR)CES}$. To calculate $C_{o(er)}$ for any value of V_{CE} less than $V_{(BR)CES}$, use this equation: $C_{o(er)}$ = -1.40E-7/V_{DS}^2 + 1.47E-8/V_{DS} + 5.95E-11.
⑦ R_G is external gate resistance, not including internal gate resistance or gate driver impedance (MIC4452).
⑧ E_{on1} is the inductive turn-on energy of the IGBT only, without the effect of a commutating diode reverse recovery current adding to the IGBT turn-on switching loss. It is measured by clamping the inductance with a Silicon Carbide Schottky diode.
⑨ E_{on2} is the inductive turn-on energy that includes a commutating diode reverse recovery current in the IGBT turn-on energy.
⑩ Eoff is the clamped inductive turn-off energy measured in accordance with JEDEC standard JESD24-1.
