## OPERATING LIMITS

The maximum current rating of the CXA2590 is dependent on the case temperature ( $T_c$ ) when the LED has reached thermal equilibrium under steady-state operation. Please refer to the Mechanical Drawings section on page 12 for the location of the  $T_c$  measurement point.

## RELATIVE SPECTRAL POWER DISTRIBUTION ( $I_f = 1200 \text{ mA}$ , $T_j = 85 \text{ }^\circ\text{C}$ )

The following graph is the result of a series of pulsed measurements at 1200 mA and  $T_j = 85 \text{ }^\circ\text{C}$ .

## ELECTRICAL CHARACTERISTICS

The following graph is the result of a series of steady-state measurements.

# PRELIMINARY

## RELATIVE LUMINOUS FLUX

The relative luminous flux values provided below are the ratio of:

- Measurements of CXA2590 at steady-state operation at the given conditions, divided by
- Flux measured during binning, which is a pulsed measurement at 1200 mA at  $T_j = 85\text{ }^\circ\text{C}$ .

For example, at steady-state operation of  $T_c = 105\text{ }^\circ\text{C}$ ,  $I_f = 1200\text{ mA}$ , the relative luminous flux ratio is 90% in the chart below. A CXA2590 LED that measures 11,000 lm during binning will deliver 9,900 lm ( $11,000 \times 0.9$ ) at steady-state operation of  $T_c = 105\text{ }^\circ\text{C}$ ,  $I_f = 1200\text{ mA}$ .

## THERMAL DESIGN

The CXA family of LED arrays can include over a hundred different LED die inside one package, and thus over a hundred different junction temperatures ( $T_j$ ). Cree has intentionally removed junction-temperature-based operating limits and replaced the commonplace maximum  $T_j$  calculations with maximum ratings based on forward current ( $I_f$ ) and case temperature ( $T_c$ ). No additional calculations are required to ensure the CXA LED is being operated within its designed limits. Please refer to page 2 for the Operating Limit specification.

Cree has measured the temperature at the bottom of the package, commonly referred to as the solder point ( $T_{sp}$ ), and found this value to be equivalent to the temperature at the  $T_c$  location at the top of the package once the LED has reached thermal equilibrium. There is no need to calculate for  $T_j$  inside the package, as the thermal management design process, specifically from  $T_{sp}$  to ambient ( $T_a$ ), remains identical to any other LED component. For more information on thermal management of Cree XLamp LEDs, please refer to the XLamp Thermal Management application note at [www.cree.com/xlamp\\_app\\_notes/thermal\\_management](http://www.cree.com/xlamp_app_notes/thermal_management). For CXA soldering recommendations and more information on thermal interface materials (TIM) and connection methods, please refer to the Cree XLamp CXA Family LEDs soldering and handling document at [www.cree.com/xlamp\\_app\\_notes/CXA\\_SH](http://www.cree.com/xlamp_app_notes/CXA_SH).

To keep the CXA2590 LED at or below the maximum rated  $T_c$ , the case to ambient temperature thermal resistance ( $R_{c-a}$ ) must be at or below the maximum  $R_{c-a}$  value shown on the following graph, depending on the operating environment. The y-axis in the graph is a base 10 logarithmic scale.

As the figure at right shows, the  $R_{c-a}$  value is the sum of the thermal resistance of the TIM ( $R_{tim}$ ) plus the thermal resistance of the heat sink ( $R_{hs}$ ).
