## Read Statement

1. The datasheets and other product information on the site are all from network reference or other public materials, and the copyright belongs to the original author and original published source. If readers and copyright owners have any objections, please contact us and we will deal with it in a timely manner.
2. The Chinese datasheets provided on the website is a Chinese translation of the English datasheets. Its purpose is for reader's learning exchange only and do not involve commercial purposes. The translation cannot be automatically updated with the original manuscript, and there may also be improper translations. Readers are advised to use the English manuscript as a reference for more accurate information.
3. All product information provided on the website refer to solutions from manufacturers' technical support or users the contents may have differences in description, and readers are advised to take the original article as the standard.
4. If you have any questions, please contact us at marketing@iczoom.com and mark the subject with "Datasheets" .

## Features

- Contactless Power Supply
- Contactless Read/Write Data Transmission
- Radio Frequency  $f_{RF}$  from 100 kHz to 150 kHz
- Basic Mode or Extended Mode
- Compatible with T5557, ATA5567
- Replacement for e5551/T5551 in Most Common Operation Modes
- Configurable for ISO/IEC 11784/785 Compatibility
- Total 363 Bits EEPROM Memory: 11 Blocks (32 Bits + 1 Lock Bit)
- High Q-antenna Tolerance Due to Build in Options
- Adaptable to Different Applications: Access Control, Animal ID and Waste Management
- On-chip Trimmed Antenna Capacitor
- Pad Options
  - ATA5577M1
    - 100  $\mu\text{m}$   $\times$  100  $\mu\text{m}$  for Wire Bonding or Flip Chip
  - ATA5577M2
    - 200  $\mu\text{m}$   $\times$  400  $\mu\text{m}$  for Direct Coil Bonding

## 1. Description

The ATA5577 is a contactless read/write **identification IC** (IDIC<sup>®</sup>) for applications in the 125-kHz or 134-kHz frequency band. A single coil connected to the chip serves as the IC's power supply and bi-directional communication interface. The antenna and chip together form a transponder or tag.

The on-chip 363-bit EEPROM (11 blocks with 33 bits each) can be read and written block-wise from a base station (reader).

Data is transmitted from the IDIC (uplink) using load modulation. This is achieved by damping the RF field with a resistive load between the two terminals Coil 1 and Coil 2. The IC receives and decodes serial base station commands (downlink), which are encoded as 100% amplitude modulated (OOK) pulse-interval-encoded bit streams.

A complete datasheet with further technical data is available on request. Please contact your local sales office.

**Read/Write LF  
RFID IDIC  
100 to 150 kHz**

**ATA5577**

**Summary**

**NOTE:** This is a summary document. The complete document is available. For more information, please contact your local Atmel sales office.

4967DS-RFID-10/08

## 2. Compatibility

The ATA5577 is designed to be compatible with the T5557/ATA5567. The structure of the configuration register is identical. The two modes, Basic mode and Extended mode, are also available. The ATA5577 is able to replace the e5551/T5551 in most common operation modes. In all applications, the correct functionality of the replacements must be evaluated and proved.

For further details, refer to Atmel®'s web site for product-relevant application notes.

## 3. System Block Diagram

Figure 3-1. RFID System Using ATA5577 Tag

## 4. ATA5577 - Functional Blocks

Figure 4-1. Block Diagram

#### 4.1 Analog Front End (AFE)

The AFE includes all circuits that are directly connected to the coil terminals. It generates the IC's power supply and handles the bi-directional data communication with the reader. It consists of the following blocks:

- Rectifier to generate a DC supply voltage from the AC coil voltage
- Clock extractor
- Switchable load between Coil 1 and Coil 2 for data transmission from the tag to the reader
- Field-gap detector for data transmission from the base station to the tag
- ESD-protection circuitry

#### 4.2 Data-rate Generator

The data rate is binary programmable to operate at any even-numbered data rate between RF/2 and RF/128 or to any of the fixed Basic mode data rates (RF/8, RF/16, RF/32, RF/40, RF/50, RF/64, RF/100 and RF/128).

#### 4.3 Write Decoder

The write decoder detects the write gaps and verifies the validity of the data stream according to the Atmel e555x downlink protocol (pulse interval encoding).

#### 4.4 HV Generator

This on-chip charge pump circuit generates the high voltage required to program the EEPROM.

#### 4.5 DC Supply

Power is externally supplied to the IDIC via the two coil connections. The IC rectifies and regulates this RF source and uses it to generate its supply voltage.

#### 4.6 Power-On Reset (POR)

The power-on reset circuit blocks the voltage supply to the IDIC until an acceptable voltage threshold has been reached.

#### 4.7 Clock Extraction

The clock extraction circuit uses the external RF signal as its internal clock source.

#### 4.8 Controller

The control logic module executes the following functions:

- Load mode register with configuration data from EEPROM block 0 after power-on and during reading
- Load option register with the settings for the analog front end stored in EEPROM page 1 block 3 after power-on and during reading
- Control all EEPROM memory read/write access and data protection
- Handles the downlink command decoding detecting protocol violations and error conditions

## 4.9 Mode Register

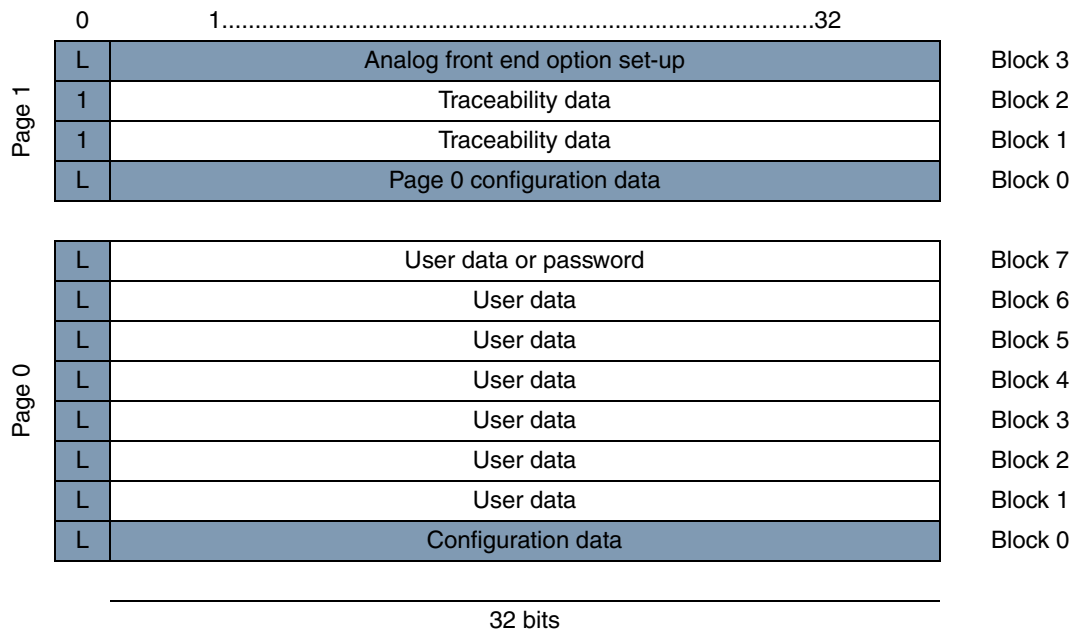

The mode register maintains a readable shadow copy of the configuration data held in block 0 of the EEPROM. It is continually refreshed during read mode and (re-)loaded after every POR event or reset command. On delivery, the mode register is pre-programmed with default values (see full version of the datasheet).

## 4.10 Modulator

The modulator encodes the serialized EEPROM data for transmission to a tag reader or base station. Several types of modulation are available including Manchester, bi-phase, FSK, PSK, and NRZ.

## 4.11 Memory

**Figure 4-2. Memory Map**

 Not transmitted

The memory is a 363-bit EEPROM, which is arranged in 11 blocks of 33 bits each. Each block includes a single *Lock* bit, which is responsible for write-protecting the associated block. Programming takes place on a block basis, so a complete block (including lock bit) can be programmed with a single command. The memory is subdivided into two page areas. Page 0 contains 8 blocks and page 1 contains 4 blocks. All 33 bits of a block, including the lock bit, are programmed simultaneously.

Block 0 of page 0 contains the mode/configuration data, which is not transmitted during regular read operations. Addressing block 0 will always affect block 0 of page 0 regardless of the page selector. Block 7 of page 0 may be used as a write-protection password.

Block 3 of page 1 contains the option register, which is not transmitted during regular-read operation.

Bit 0 of every block is the lock bit for that block. Once locked, the block (including the lock bit itself) is not re-programmable via the RF field.

Blocks 1 and 2 of page 1 contain traceability data and are transmitted with the modulation parameters defined in the configuration register after the opcode “11” is issued by the reader. The traceability data blocks are programmed and locked by Atmel.

## 5. Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

| Parameters   | Symbol              | Value       | Unit |
|--|---------------------|-------------|------|
| Maximum DC current into Coil1/Coil2                                    | $I_{\text{coil}}$   | 20 (TBD)    | mA   |
| Maximum AC current into Coil1/Coil2, $f = 125$ kHz                     | $I_{\text{coil p}}$ | 20 (TBD)    | mA   |
| Power dissipation (die) (free-air condition, time of application: 1s)  | $P_{\text{tot}}$    | 100 (TBD)   | mW   |
| Electrostatic discharge maximum to ANSI/ESD-STM5.1-2001 standard (HBM) | $V_{\text{max}}$    | 2000 (TBD)  | V    |
| Operating ambient temperature range                                    | $T_{\text{amb}}$    | -40 to +85  | °C   |
| Storage temperature range (data retention reduced)                     | $T_{\text{stg}}$    | -40 to +150 | °C   |

## 6. Electrical Characteristics

$T_{amb} = +25^{\circ}\text{C}$ ;  $f_{coil} = 125 \text{ kHz}$ ; unless otherwise specified

| No. | Parameters  | Test Conditions  | Symbol                | Min.   | Typ. | Max.        | Unit                   | Type* |
|-----|---|--|-----------------------|--------|------|-------------|------------------------|-------|
| 1   | RF frequency range  |  | $f_{RF}$              | 100    | 125  | 150         | kHz                    |       |
