Features

- **Reference Oscillator up to 15 MHz**
- **Two Programmable 16-bit Dividers Adjustable from 2 to 65535**
- **Fine Tuning Steps**
  - **AM ≥ 1 kHz**
  - **FM ≥ 2 kHz**
- **Loop-push-pull Stage for AM/FM**
- **High Signal/Noise Ratio**

AM/FM PLL with 1 Switch

U4289BM

Description

The U4289BM is an integrated circuit in BICMOS technology for frequency synthesizers. It performs all the functions of a PLL radio tuning system and is controlled by a 2-wire bus. The device is designed for all frequency synthesizer applications in radio receivers, as well as for RDS (Radio Data System) applications.

Pin Description

Pin	Symbol	Function
1	V_{DD}	Supply voltage
2	SCL	Bus clock
3	SDA	Bus data
4	AS	Address selection
5	SWO1	Switching output
6	FMOSC	FM oscillator input
7	GND2	Ground 2 (analog)
8	AMOSC	AM oscillator input
9	PDFM	FM current output
10	PDFMO	FM analog output
11	PDAM	AM current output
12	PDAMO	AM analog output
13	VA	Analog supply voltage
14	OSCIN	Oscillator input
15	OSCOUT	Oscillator output
16	GND1	Ground 1 (digital)

Functional Description

The U4289BM is controlled via the 2-wire bus. One module address byte, two subaddress bytes and five data bytes enable programming.

The module address contains a programmable address bit A 1, which (along with address select input AS, pin 4), enables the operation of two U4289BM devices in one system. If bit A 1 is identical with the status of the address select input AS, the chip is selected.

The subaddress determines which of the data bytes is transmitted first. If the subaddress of the R-divider is transmitted, the sequence of the next data bytes is DB 0 (Status), DB 1 and DB 2. If the subaddress of the N-divider is transmitted, the sequence of the next data bytes is DB 3 and DB 4. The bit organization of the module address, subaddress and 5 data bytes is shown in table “Bit Organization” on page 7.

Each transmission on the bus begins with the “START” condition and has to be ended by the “STOP” condition (see table “Transmission Protocol” on page 7).

The integrated circuit U4289BM has two separate inputs for the AM and FM oscillators. Pre-amplified AM and FM signals are fed to the 16-bit R-divider via the AM/FM switch. The AM/FM switch is software controlled. Tuning steps can be selected by the 16-bit R-divider.

Furthermore, the device provides a digital memory phase detector and two separate current sources for AM and FM amplifier (charge pump) as given in the Table “Electrical Characteristics” on page 4. It allows independent gain adjustment, providing high current for high-speed tuning and low current for stable tuning.

Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

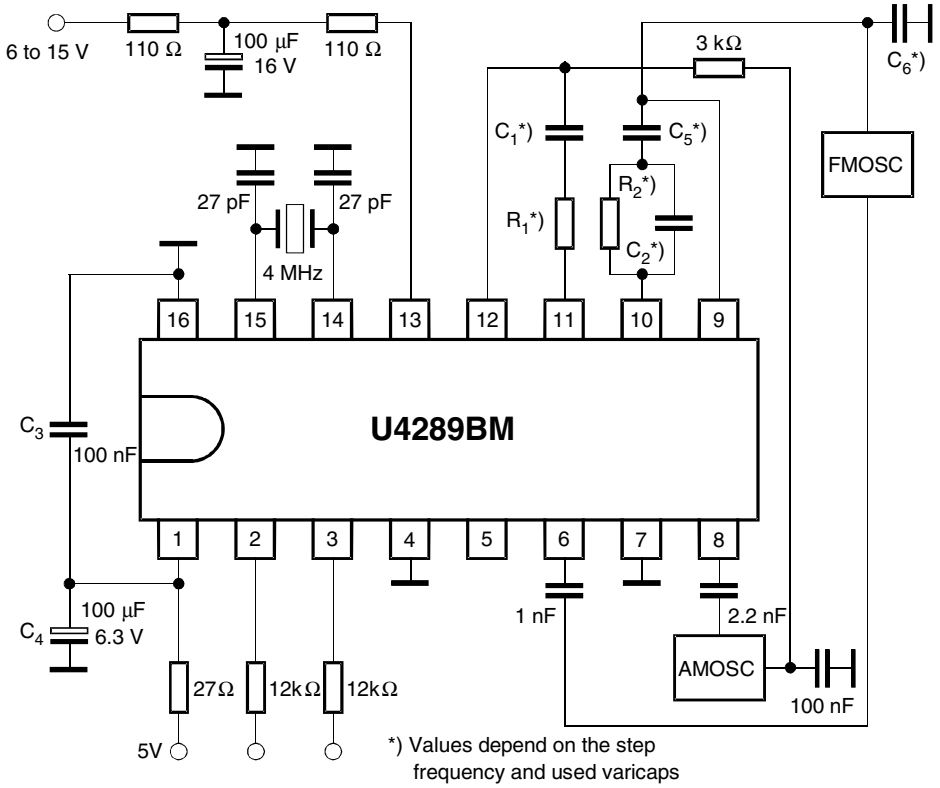
Figure 8. Application Circuit



Recommendations for Applications

- C_3 = 100 nF should be very close to pin 1 (V_{DD}) and pin 16 (GND 1)
- GND2 (pin 7, analog ground) and GND1 (pin 16, digital around) must be connected according to Figure 8
- 4 MHz crystal must be very close to pin 14 and pin 15
- Components of the charge pump (C_1/R_1 for AM and C_2/R_2 for FM) should be very close to pin 11 with respect to pin 10.
