## Features

- Fully Integrated TX/RX with VCO
- Fast Settling Synthesizer
- Unlimited Multi-slot Operation with Advanced Closed-loop Modulation
- No Mechanical Tuning Required
- Low Current Consumption
- Auxiliary Voltage Regulator On-chip (3.2 V to 4.6 V)
- Supply-voltage Range 3 V to 4.6 V (Regulated)
- Ramp-signal Generator for Power Ramping and Power Control of External SiGe Power Amplifier (T7024 and T7026)
- Supports Multiple Reference Clocks (10.368 MHz/13.824 MHz/20.736 MHz/27.648 MHz)
- TX Pre-amplifier with 3 dBm Output Power at 2.45 GHz
- Few Low-cost External Components

Electrostatic sensitive device.  
Observe precautions for handling.

## Description

The T2802 is an RF IC for low-power applications in the 2.45 GHz ISM band. The QFN48-packaged IC is a complete transceiver including image rejection mixer, IF amplifier, FM demodulator, baseband filter, RSSI, TX pre-amplifier, power-ramping generator for power amplifiers, integrated synthesizer, fully integrated VCO, TX filter and modulation compensation circuit for advanced closed-loop modulation concept. No mechanical tuning is necessary in production.

## Functional Description

### Receiver

The RF signal at RF\_IN is fed to an image rejection mixer IR\_MIXER with its differential outputs MIXER\_OUT1 and MIXER\_OUT2 driving an IF-SAW filter at 110.592 MHz or 112.32 MHz. The IF amplifiers IF\_AMP1 and IF\_AMP2 with an external IF\_TANK and an integrated RSSI function feed the signal to the demodulator DEMOD working at  $f = f_{IF}/2$  ( $\approx 55$  MHz) and finally to an integrated baseband filter BB. For demodulator tuning in production an integrated 5-bit digital-to-analog (D/A) converter is provided to control the on-chip varicap diode.

### Transmitter

The transmit data at TX\_DATA is filtered by an integrated Gaussian Filter GF and fed to the fully integrated VCO operating at twice the output frequency. After modulation the signal is frequency-divided by 2 and fed via a TX/RX SWITCH to the TX\_DRIVER. This bus-controlled driver amplifier supplies typically +3 dBm output power at TX\_OUT. A ramp-signal generator RAMP\_GEN, providing a ramp signal at RAMP\_OUT for the external power amplifier, is integrated. The slope of the ramp signal is controlled by a capacitor at the RAMP\_SET pin.

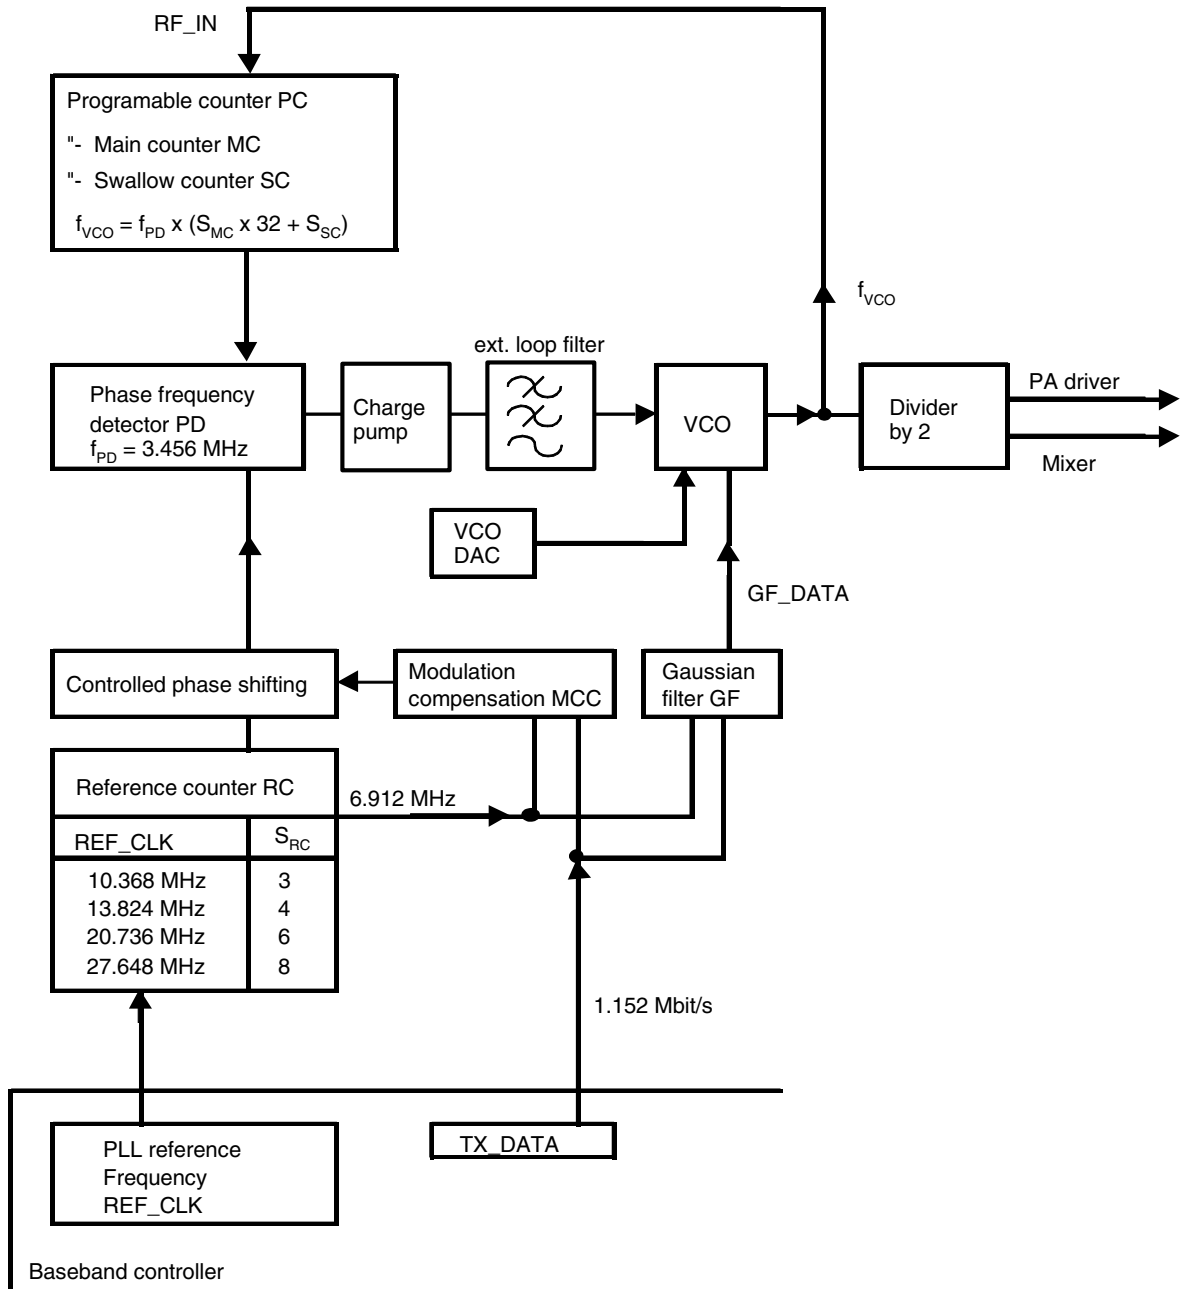

### Synthesizer

The IR\_MIXER, the TX\_DRIVER and the programmable counter PC are driven by the fully integrated VCO (including on-chip inductors and varactors). A 3-bit digital-to-analog converter is used to pretune the frequency. The output signal is frequency-divided to supply the desired frequency to the TX\_DRIVER, 0/90 degree phase shifter for the IR\_MIXER and to be used by the PC for the phase detector PD ( $f_{PD} = 3.456$  MHz). Unlimited multislot operation is possible by using the integrated advanced closed-loop modulation concept based on the modulation compensation circuit MCC.

### Power Supply

An integrated bandgap-stabilized voltage regulator for use with an external low-cost PNP transistor is implemented. Multiple power-down and current saving modes are provided.

Figure 3. PLL Principle

The following table shows the LO frequencies for RX and TX for the DECT band plus additional channels for the extended DECT band. Intermediate frequencies of 110.592 MHz and 112.32 MHz are supported.

## Serial Programming Bus

The transceiver is programmed by the 3-wire bus (CLOCK, DATA and ENABLE).

After the setting enable signal to low condition on the rising edge of the clock signal, the data is transferred bit by bit into the shift register, starting with the MSB-bit. When the enable signal has returned to high condition, the programmed information is loaded into the addressed latches according to the address bit condition (last bit). Additional leading bits are ignored and there is no check made how many pulses arrived during enable low condition. During enable low condition the bus current is increased to speed up the bus logic.

To keep all information in the registers during standby, DATA\_HOLD must be set to high condition. In this case the power-down current is below 100  $\mu\text{A}$ .

The programming of the transceiver is separated into two data words. Data word 1 controls mainly the channel information together with settings, which are closely related with the channel. Dataword 2 holds setup information, which is adjusted during production.
