[1]	Typical values are not guaranteed.
[2]	Includes the current through the internal 400 kΩ pull-up resistor connected to digital I/O Vdd.
[3]	Range defined as $\sqrt{x^2+y^2+z^2} \leq 2g$. The measuring range is tested on sensing element level. FS = 2g.
[4]	Includes effects over supply voltage, temperature and life time
[6]	Sensitivity = {Count(+1g) - Count(-1g)}/2 [Count/g].
[7]	From straight line through sensitivity calibration (+1g, -1g) points.
[8]	The cross-axis sensitivity determines how much acceleration, perpendicular to the measuring axis, couples to the output. The total cross-axis sensitivity is the geometric sum of the sensitivities of the two axes which are perpendicular to the measuring axis. The angular alignment error between X, Y and Z axis is included into the cross axis sensitivity.
[9]	Frequency responses according to Figure 4.
[10]	Average noise/axis over the measurement bandwidth defined as $\sqrt{\frac{1}{3}(n_x{}^2+n_y{}^2+n_z{}^2)}$, where nx, ny and nz are the measured signal's standard deviation due to noise in x, y and z directions.
[11]	Settling error less than 1% of FS.
