## General Description

The ICS813078I is a member of the HiperClocks family of high performance clock solutions from IDT. The ICS813078I a PLL based synchronous clock solution that is optimized for wireless infrastructure equipment where frequency translation and jitter attenuation is needed.
The device contains two internal PLL stages that are cascaded in series. The first PLL stage attenuates the reference clock jitter by using an internal or external VCXO circuit. The internal VCXO requires the connection of an external inexpensive pullable crystal (XTAL) to the ICS8130781. This first PLL stage (VCXO PLL) uses external passive loop filter components which are used to optimize the PLL loop bandwidth and damping characteristics for the given application. The output of the first stage VCXO PLL is a stable and jitter-tolerant 30.72 MHz reference input for the second PLL stage. The second PLL stage provides frequency translation by multiplying the output of the first stage up to 491.52 MHz or 614.4 MHz . The low phase noise characteristics of the VCXO-PLL clock signal is maintained by the internal FemtoClock ${ }^{\text {TM }}$ PLL, which requires no external components or complex programming. Two independently configurable frequency dividers translate the internal VCO signal to the desired output frequencies. All frequency translation ratios are set by device configuration pins.
Supported input reference clock frequencies:
$10 \mathrm{MHz}, 12.8 \mathrm{MHz}, 15 \mathrm{MHz}, 15.36 \mathrm{MHz}, 20 \mathrm{MHz}, 30.72 \mathrm{MHz}$, 61.44 MHz , and 122.88 MHz

Supported output clock frequencies:
$30.72 \mathrm{MHz}, 38.4 \mathrm{MHz}, 61.44 \mathrm{MHz}, 76.8 \mathrm{MHz}, 122.88 \mathrm{MHz}$, $153.6 \mathrm{MHz}, 245.76 \mathrm{MHz}, 491.52 \mathrm{MHz}$, and 614.4 MHz

## Features

- Nine outputs, organized in three independent output banks with differential LVPECL and single-ended outputs
- One differential input clock can accept the following differential input levels: LVDS, LVPECL, LVHSTL
- One single-ended clock input
- Frequency generation optimized for wireless infrastructure
- Attenuates the phase jitter of the input clock signal by using low-cost pullable fundamental mode crystal (XTAL)
- Internal Femtoclock frequency multiplier stage eliminates the need for an expensive external high frequency VCXO
- LVCMOS levels for all control I/O
- RMS phase jitter @ 122.88MHz, using a 30.72 MHz crystal ( 12 kHz to 20 MHz ): 1.1ps rms (typical)
- RMS phase jitter @ 61.44MHz, using a 30.72MHz crystal (12kHz to 20MHz): 0.97ps rms (typical)
- VCXO PLL bandwidth can be optimized for jitter attenuation and reference frequency tracking using external loop filter components
- PLL fast-lock control
- PLL lock detect output
- Absolute pull range is $+/-50 \mathrm{ppm}$
- Full 3.3 V supply voltage
- $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ ambient operating temperature
- Available in lead-free (RoHS 6) package
- For replacement device use 8T49N285-dddNLGI

## Pin Assignment

## Device Configuration

The ICS813078I is a two stage device, a VCXO-PLL stage followed by a low phase noise FemtoClock PLL multiplier stage. The VCXO-PLL stage uses a pullable crystal to lock to the reference clock. The low phase noise FemtoClock multiplies the VCXO-PLL output clock up to 491.52 MHz or 614.4 MHz and three independent output dividers scale the frequency down to the desired output frequencies. With a given input and VCXO frequency, the output frequency is a function of the $P, M F, M V$ and the NA, NB and NC dividers. The $P$ and MV are controlled by the $\mathrm{R}[2: 0]$ control pins through the internal lookup table (LUT).

The VCXO-PLL pre-divider ( P ) down-scales the input reference frequency $f_{\text {REF }}$ and enables the use of the ICS813078I at a variety of input frequencies. P and MV must be set to match the VCXO frequency: $f_{R E F} \div P=f_{V C X O} \div M V$. For example, at the nominal VCXO frequency of 30.72 MHz and if MV equals one, the input frequency must be an integer multiple of 30.72 MHz (for $\mathrm{MV}=2$, the input frequency must be an integer multiple of 15.36 MHz ). The FemtoClock PLL stage multiplies the VCXO frequency $(30.72 \mathrm{MHz})$ to 614.4 MHz or 491.52 MHz by a multiplier MF of 20 or 16 . The output frequency equals $\left[\left(f_{R E F} \div P\right) * M V * M F\right] \div N A$, NB, or NC. The NA, NB and NC dividers operate independently.

Table 3A. Input Frequency Configuration Example Table (fVCXO $=30.72 \mathrm{MHz}$ )

| fref <br> $\mathbf{( M H z )}$ | Input | Internal Dividers |  | fXTAL <br> $\mathbf{( M H z )}$ |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{R [ 2 : 0 ]}$ | $\mathbf{P}$ | $\mathbf{M V}$ |  |
| 61.44 | 000 | 1 | 1 | 30.72 |
| 122.88 | 010 | 4 | 1 | 30.72 |
| 15.36 | 011 | 1 | 2 | 30.72 |
| 10 | 100 | 125 | 384 | 30.72 |
| 12.8 | 101 | 5 | 12 | 30.72 |
| 15 | 110 | 125 | 256 | 30.72 |
| 20 | 111 | 125 | 192 | 30.72 |

Table 3B. PLL Output-Divider (NA) Configuration Table.

| Inputs |  | Output-Divider NA | Operation | QAn Output Frequency (MHz) |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NA1 | NAO |  |  | MF = 0 | MF = 1 |
| 0 (default) | 0 (default) | 2 | $\mathrm{f}_{\mathrm{QAn}}=\mathrm{f}_{\mathrm{VCO}} \div 2$ | 245.76 | 307.2 |
| 0 | 1 | 4 | $\mathrm{f}_{\mathrm{QAn}}=\mathrm{f}_{\mathrm{VCO}} \div 4$ | 122.88 | 153.6 |
| 1 | 0 | 5 | $\mathrm{f}_{\mathrm{QAn}}=\mathrm{f}_{\mathrm{VCO}} \div 5$ | 98.304 | 122.88 |
| 1 | 1 | 8 | $\mathrm{f}_{\mathrm{QAn}}=\mathrm{f}_{\mathrm{VCO}} \div 8$ | 61.44 | 76.8 |

Table 3C. PLL Output-Divider (NB) Configuration Table.

| Inputs |  | Output-Divider NB | Operation | QBn Output Frequency (MHz) |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NB1 | NBO |  |  | MF = 0 | MF = 1 |
| 0 (default) | 0 (default) | 1 | $\mathrm{f}_{\mathrm{QBn}}=\mathrm{f}_{\mathrm{VCO}} \div 1$ | 491.52 | 614.4 |
| 0 | 1 | 4 | $\mathrm{f}_{\mathrm{QBn}}=\mathrm{f}_{\mathrm{VCO}} \div 4$ | 122.88 | 153.6 |
| 1 | 0 | 5 | $\mathrm{f}_{\mathrm{QBn}}=\mathrm{f}_{\mathrm{VCO}} \div 5$ | 98.304 | 122.88 |
| 1 | 1 | 8 | $\mathrm{f}_{\mathrm{QBn}}=\mathrm{f}_{\mathrm{VCO}} \div 8$ | 61.44 | 76.8 |

Table 3D. PLL Output-Divider (NC) Configuration Table.

| Inputs |  | Output-Divider NC | Operation | QCn Output Frequency (MHz) |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NC1 | NCO |  |  | MF = 0 | MF = 1 |
| 0 (default) | 0 (default) | 4 | $\mathrm{f}_{\mathrm{QCn}}=\mathrm{f}_{\mathrm{VCO}} \div 4$ | 122.08 | 153.6 |
| 0 | 1 | 5 | $\mathrm{f}_{\mathrm{QCn}}=\mathrm{f}_{\mathrm{VCO}} \div 5$ | 98.304 | 122.88 |
| 1 | 0 | 8 | $\mathrm{f}_{\mathrm{QCn}}=\mathrm{f}_{\mathrm{VCO}} \div 8$ | 61.44 | 76.8 |
| 1 | 1 | 16 | $\mathrm{f}_{\mathrm{QCn}}=\mathrm{f}_{\mathrm{VCO}} \div 16$ | 30.72 | 38.4 |

Table 3E. Femtoclock PLL Feedback Divider (MF) Configuration Table ( $\mathrm{f}_{\mathrm{XTAL}}=\mathbf{3 0 . 7 2 M H z}$ )

| Input |  |  |
| :---: | :---: | :--- |
| $\mathbf{~ M F ~}$ | Feedback Divider MF | Operation |
| 0 (default) | 16 | $\mathrm{f}_{\mathrm{VCO}}=\mathrm{f}_{\mathrm{VCxO}} \times 16=491.52 \mathrm{MHz}$ |
| 1 | 20 | $\mathrm{f}_{\mathrm{VCO}}=\mathrm{f}_{\mathrm{VCxO}} \times 20=614.4 \mathrm{MHz}$ |

Table 3F. Input Reference Clock Multiplexer (REF_SEL) Configuration Table

| Input |  |
| :---: | :--- |
| REF_SEL | Operation |
| 0 (default) | Selects CLK0, nCLK0 differential input pair as reference frequency. |
| 1 | Selects CLK1 single-ended input as reference frequency. |

The input reference selector should be tied to logic 0 , selecting the differential clock inputs, for best signal integrity and lowest phase noise

Table 3G. PLL Bypass (BYPASS) Configuration Table

| Input |  |  |
| :---: | :---: | :--- |
| BYPASS1 | BYPASS0 | Operation |

The BYPASS[1:0] controls should be set to logic LOW level for normal operation. BYPASS $=1 x$ enables the PLL bypass mode for factory test. In PLL Bypass Mode, the output frequency is divided by NA, NB, or NC dividers.

## Table 3H. Fast Lock Mode (FLM) Configuration Table

| Input |  |
| :---: | :--- |
| FLM | Operation |
| 0 (default) | Normal operation. |
| 1 | Fast PLL lock operation. Use this mode only during startup to decrease PLL lock time. |

Figure 1. Recommended Start-up Timing Diagram
Table 3I. Reset (nMR) Configuration Table

| Input |  |
| :---: | :--- |
| nMR | Operation |
| 0 | The Femto-PLL is reset. |
| 1 (default) | Normal operation. |

Table 3J. Output Disable (nSTOPA) Configuration Table.

| Input |  |
| :---: | :--- |
| nSTOPA | Operation |
| 0 | QA[2:0]/nQA[2:0] outputs are stopped in logic LOW state. The assertion of nSTOPA is asynchronous <br> to the internal clock signal and may cause an output runt pulse. |
| 1 (default) | Normal operation and outputs enabled. |

Table 3K. Output Disable (nSTOPB) Configuration Table.

| Input |  |
| :---: | :--- |
| nSTOPB | Operation |
| 0 | QB[1:0] / nQB[1:0] outputs are stopped in logic LOW state. The assertion of nSTOPB is <br> asynchronous to the internal clock signal and may cause an output runt pulse. |
| 1 (default) | Normal operation and outputs enabled. |

Table 3L. Output Disable (nSTOPC) Configuration Table.

| Input |  |
| :---: | :--- |
| nSTOPC | Operation |
| 0 | QC[3:0] outputs are stopped in logic LOW state. The assertion of nSTOPC is asynchronous to the <br> internal clock signal and may cause an output runt pulse. |
| 1 (default) | Normal operation and outputs enabled. |

Table 3M. PLL Lock Status Output (LOCK_DT) Configuration Table.

| Conditions | Output |
| :---: | :--- |
|  | LOCK_DT |
| Locked | Constantly HIGH. |
| Unlocked | HIGH with occasional LOW pulses. |

## Absolute Maximum Ratings

NOTE: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device.
These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the DC Characteristics or AC Characteristics is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

| Item | Rating |
| :--- | :--- |
| Supply Voltage, $\mathrm{V}_{\mathrm{CC}}$ | 4.6 V |
| Inputs, $\mathrm{V}_{\mathrm{I}}$ | -0.5 V to $\mathrm{V}_{\mathrm{CC}}+0.5 \mathrm{~V}$ |
| Outputs, $\mathrm{I}_{\mathrm{O}}$ (LVPECL) |  |
| Continus Current | 50 mA |
| Surge Current | 100 mA |
|  | -0.5 V to $\mathrm{V}_{\mathrm{CcO}} \mathrm{CMOS}+0.5 \mathrm{~V}$ |
| Outputs, $\mathrm{V}_{\mathrm{O}}$ (LVCMOS) | $31.8^{\circ} \mathrm{C} / \mathrm{W}(0 \mathrm{mps})$ |
| Package Thermal Impedance, $\theta_{\mathrm{JA}}$ | $-65^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$ |
| Storage Temperature, $\mathrm{T}_{\mathrm{STG}}$ |  |

## Application Information

## VCXO-PLL External Components

Choosing the correct external components and having a proper printed circuit board (PCB) layout is a key task for quality operation of the VCXO-PLL. In choosing a crystal, special precaution must be taken with the package and load capacitance $\left(\mathrm{C}_{\mathrm{L}}\right)$. In addition, frequency, accuracy and temperature range must also be considered. Since the pulling range of a crystal also varies with the package, it is recommended that a metal-canned package like HC49 be used. Generally, a metal-canned package has a larger pulling range than a surface mounted device (SMD). For crystal selection information, refer to the VCXO Crystal Selection Application Note.
The crystal's load capacitance $C_{L}$ characteristic determines its resonating frequency and is closely related to the VCXO tuning range. The total external capacitance seen by the crystal when installed on a board is the sum of the stray board capacitance, IC package lead capacitance, internal varactor capacitance and any installed tuning capacitors ( $\mathrm{C}_{\text {TUNE }}$ ).
If the crystal $C_{L}$ is greater than the total external capacitance, the VCXO will oscillate at a higher frequency than the crystal specification. If the crystal $C_{L}$ is lower than the total external
capacitance, the VCXO will oscillate at a lower frequency than the crystal specification. In either case, the absolute tuning range is reduced. The correct value of $\mathrm{C}_{\mathrm{L}}$ is dependant on the characteristics of the VCXO. The recommended $\mathrm{C}_{\mathrm{L}}$ in the Crystal Parameter Table balances the tuning range by centering the tuning curve.

The VCXO-PLL Loop Bandwidth Selection Table shows $\mathrm{R}_{\mathrm{S}}, \mathrm{C}_{\mathrm{S}}$ and $C_{P}$ values for recommended high, mid and low loop bandwidth configurations. The device has been characterized using these parameters. For other configurations, refer to the Loop Filter Component Selection for VCXO Based PLLs Application Note.
The crystal and external loop filter components should be kept as close as possible to the device. Loop filter and crystal traces should be kept short and separated from each other. Other signal traces should be kept separate and not run underneath the device, loop filter or crystal components.

## VCXO Characteristics Table

| Symbol | Parameter | Typical | Units |
| :--- | :--- | :---: | :---: |

## Wiring the Differential Input to Accept Single Ended Levels

Figure 2 shows how the differential input can be wired to accept single ended levels. The reference voltage $\mathrm{V} \_\mathrm{REF}=\mathrm{V}_{\mathrm{cc}} / 2$ is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio of R1 and R2 might need to be adjusted to position the V_REF in the center of the input voltage swing. For example, if the input clock swing is only 2.5 V and $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}, \mathrm{~V} \_$REF should be 1.25 V and R2/R1 $=0.609$.

Figure 2. Single-Ended Signal Driving Differential Input

## Power Supply Filtering Technique

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The ICS813078I provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. $\mathrm{V}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{CCA}}, \mathrm{V}_{\mathrm{CCO}}$ and $\mathrm{V}_{\text {CCO_CMOS }}$ should be individually connected to the power supply plane through vias, and $0.01 \mu \mathrm{~F}$ bypass capacitors should be used for each pin. Figure 3 illustrates this for a generic $\mathrm{V}_{\mathrm{CC}}$ pin and also shows that $\mathrm{V}_{\text {CCA }}$ requires that an additional $10 \Omega$ resistor along with a $10 \mu \mathrm{~F}$ bypass capacitor be connected to the $\mathrm{V}_{\mathrm{CCA}}$ pin.

Figure 3. Power Supply Filtering

## Differential Clock Input Interface

The CLK /nCLK accepts LVDS, LVPECL, LVHSTL, SSTL, HCSL and other differential signals. Both $\mathrm{V}_{\text {SWING }}$ and $\mathrm{V}_{\mathrm{OH}}$ must meet the $\mathrm{V}_{\mathrm{PP}}$ and $\mathrm{V}_{\mathrm{CMR}}$ input requirements. Figures 4 A to 4 F show interface examples for the HiPerClockS CLK/nCLK input driven by the most common driver types. The input interfaces suggested here are examples only. Please consult with the vendor of the driver

Figure 4A. HiPerClockS CLK/nCLK Input Driven by an IDT Open Emitter HiPerClockS LVHSTL Driver

Figure 4C. HiPerClockS CLK/nCLK Input Driven by a 3.3V LVPECL Driver

Figure 4E. HiPerClockS CLK/nCLK Input Driven by a 3.3V HCSL Driver
component to confirm the driver termination requirements. For example, in Figure 4A, the input termination applies for IDT HiPerClockS open emitter LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

Figure 4B. HiPerClockS CLK/nCLK Input Driven by a 3.3V LVPECL Driver

Figure 4D. HiPerClockS CLK/nCLK Input Driven by a 3.3V LVDS Driver

Figure 4F. HiPerClockS CLK/nCLK Input Driven by a 2.5V SSTL Driver

## Recommendations for Unused Input and Output Pins

## Inputs:

## CLK/nCLK Inputs

For applications not requiring the use of the differential input, both CLK and nCLK can be left floating. Though not required, but for additional protection, a $1 \mathrm{k} \Omega$ resistor can be tied from CLK to ground.

## CLK Input

For applications not requiring the use of a clock input, it can be left floating. Though not required, but for additional protection, a $1 \mathrm{k} \Omega$ resistor can be tied from the CLK input to ground.

## LVCMOS Control Pins

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A $1 \mathrm{k} \Omega$ resistor can be used.

## Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

## Outputs:

## LVPECL Outputs

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

## LVCMOS Outputs

All unused LVCMOS output can be left floating. There should be no trace attached.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50W transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. Figures $5 A$ and $5 B$ show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Figure 5B. 3.3V LVPECL Output Termination

## EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in Figure 6. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as "heat pipes". The number of vias (i.e. "heat pipes") are application specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is
achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13 mils ( 0.30 to 0.33 mm ) with $10 z$ copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, refer to the Application Note on the Surface Mount Assembly of Amkor's Thermally/Electrically Enhance Leadfame Base Package, Amkor Technology.

Figure 6. Assembly for Exposed Pad Thermal Release Path - Side View (drawing not to scale)

## Power Considerations

This section provides information on power dissipation and junction temperature for the ICS813078I.
Equations and example calculations are also provided.

## 1. Power Dissipation.

The total power dissipation for the ICS813078l is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}+5 \%=3.465 \mathrm{~V}$, which gives worst case results.

## Core and LVPECL Output Power Dissipation

- Power (core)_MAX $=\mathrm{V}_{\text {CC_MAX }} \mathrm{I}_{\text {EE_MAX }}=3.465 \mathrm{~V} * 260 \mathrm{~mA}=900.9 \mathrm{~mW}$

Power (output)_MAX $=\mathbf{3 0 m W} /$ Loaded Output Pair
If all outputs are loaded, the total power is $5 * 30 \mathrm{~mW}=150 \mathrm{~mW}$

## LVCMOS Output Power Dissipation

- Output Impedance R R

Output Current $\mathrm{I}_{\text {OUT }}=\mathrm{V}_{\text {CCO_MAX }} /\left[2\right.$ * $\left.\left(50 \Omega+\mathrm{R}_{\text {OUT }}\right)\right]=3.465 \mathrm{~V} /[2$ * $(50 \Omega+15 \Omega)]=\mathbf{2 6 . 7 m A}$

- Power Dissipation on the R $\mathrm{R}_{\text {OUt }}$ per LVCMOS output
$\operatorname{Power}($ R OUT $)=$ R OUT $^{*}\left(\mathrm{l}_{\text {OUT }}\right)^{2}=15 \Omega$ * $(26.7 \mathrm{~mA})^{2}=10.7 \mathrm{~mW}$ per output
- Total Power Dissipation on the ROUT

Total Power $\left(R_{\text {OUT }}\right)=10.7 \mathrm{~mW}$ * $4=42.8 \mathrm{~mW}$

- Dynamic Power Dissipation at 153.6 MHz

Power $(25 \mathrm{MHz})=\mathrm{C}_{\mathrm{PD}}$ * Frequency * $\left(\mathrm{V}_{\mathrm{CCO}}\right)^{2}=10 \mathrm{pF}$ * 153.6 MHz * $(3.465 \mathrm{~V})^{2}=\mathbf{1 8 m W}$ per output
Total Power $(153.6 \mathrm{MHz})=18 \mathrm{~mW}$ * $4=72 \mathrm{~mW}$

## Total Power Dissipation

- Total Power
$=$ Power (core) + Power (LVPECL output) + Total Power ( $\mathrm{R}_{\mathrm{OUT}}$ ) + Total Power (153.6MHz)
$=900.9 \mathrm{~mW}+150 \mathrm{~mW}+42.8 \mathrm{~mW}+72 \mathrm{~mW}$
$=1165.7 \mathrm{~mW}$

## 2. Junction Temperature.

Junction temperature, Tj, is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS devices is $125^{\circ} \mathrm{C}$.

The equation for $\mathrm{Tj}_{\mathrm{j}}$ is as follows: $\mathrm{Tj}=\theta_{\mathrm{JA}}$ * Pd _total $+\mathrm{T}_{\mathrm{A}}$
$\mathrm{Tj}=$ Junction Temperature
$\theta_{\mathrm{JA}}=$ Junction-to-Ambient Thermal Resistance
Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)
$\mathrm{T}_{\mathrm{A}}=$ Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance $\theta_{\mathrm{JA}}$ must be used. Assuming no air flow and a multi-layer board, the appropriate value is $31.8^{\circ} \mathrm{C} / \mathrm{W}$ per Table 6 below.

Therefore, Tj for an ambient temperature of $85^{\circ} \mathrm{C}$ with all outputs switching is:
$85^{\circ} \mathrm{C}+1.166 \mathrm{~W} * 31.8^{\circ} \mathrm{C} / \mathrm{W}=122.1^{\circ} \mathrm{C}$. This is below the limit of $125^{\circ} \mathrm{C}$.
This calculation is only an example. Tj will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (single layer or multi-layer).

Table 6. Thermal Resistance $\theta_{\mathrm{JA}}$ for 64 Lead TQFP, E-Pad Forced Convection
