### Description

The 553S is a low skew, single input to four output, clock buffer. The 553S has best in class additive phase Jitter of sub 50 fsec.

IDT makes many non-PLL and PLL based low skew output devices as well as Zero Delay Buffers to synchronize clocks. Contact us for all of your clocking needs.

### Features

- Low additive phase jitter RMS: 50fs
- Extremely low skew outputs (50ps)
- Low cost clock buffer
- Packaged in 8-pin SOIC and small 8-pin DFN package, Pb-free
- Input/Output clock frequency up to 200 MHz
- Ideal for networking clocks
- Operating Voltages: 1.8V to 3.3V
- Output Enable mode tri-states outputs
- Advanced, low power CMOS process
- Extended temperature range (-40°C to +105°C)

## Pin Assignments

## Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	VDD	Power	Connect to +1.8V, +2.5 V, or +3.3 V.
2	Q0	Output	Clock output 0.
3	Q1	Output	Clock output 1.
4	GND	Power	Connect to ground.
5	ICLK	Input	Clock input.
6	Q2	Output	Clock Output 2.
7	Q3	Output	Clock Output 3.
8	OE	Input	Output Enable. Tri-states outputs when low. Connect to VDD for normal operation.

## External Components

A minimum number of external components are required for proper operation. A decoupling capacitor of 0.01  $\mu$ F should be connected between VDD on pin 1 and GND on pin 4, as close to the device as possible. A 33  $\Omega$  series terminating resistor may be used on each clock output if the trace is longer than 1 inch.

To achieve the low output skew that the 553S is capable of, careful attention must be paid to board layout. Essentially, all four outputs must have identical terminations, identical loads and identical trace geometries. If they do not, the output skew will be degraded. For example, using a 30 $\Omega$  series termination on one output (with 33 $\Omega$  on the others) will cause at least 15 ps of skew.

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 553S. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

2. Between any 2 outputs with equal loading.
3. Duty cycle on outputs will match incoming clock duty cycle. Consult IDT for tight duty cycle clock generators.

## Phase Noise Plots

**Figure 1. 553S Reference Phase Noise 66fs (12kHz to 20MHz)**

**Figure 2. 553S Output Phase Noise 76fs (12kHz to 20MHz)**

The phase noise plots above show the low Additive Jitter of the 553S high-performance buffer. With an integration range of 12kHz to 20MHz, the reference input has about 66fs of RMS phase jitter while the output of 553S has about 76fs of RMS phase jitter. This results in a low Additive Phase Jitter of only 37fs.
