GENERAL DESCRIPTION

The 85211I-01 is a low skew, high performance 1-to-2 Differential-to-HSTL Fanout Buffer. The CLK, nCLK pair can accept most standard differential input levels. The 85211I-01 is characterized to operate from a 3.3V power supply. Guaranteed output and part-to-part skew characteristics make the 85211I-01 ideal for those clock distribution applications demanding well defined performance and repeatability. For optimal performance, terminate all outputs.

FEATURES

- Two differential HSTL compatible outputs
- One differential CLK, nCLK input pair
- CLK, nCLK pair can accept the following differential input levels: LVDS, LVPECL, HSTL, SSTL, HCSL
- Maximum output frequency: 700MHz
- Translates any single-ended input signal to HSTL levels with resistor bias on nCLK input
- Output skew: 30ps (maximum)
- Part-to-part skew: 250ps (maximum)
- Propagation delay: 1ns (maximum)
- Output crossover Voltage: 0.68V to 0.9V
- Output duty cycle: 49% - 51% up to 266.6MHz
- $V_{OH} = 1.4V$ (maximum)
- 3.3V operating supply
- -40°C to 85°C ambient operating temperature
- Available in lead-free RoHS-compliant package
- **For functional replacement use 8523**

APPLICATION INFORMATION

WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 1 shows how the differential input can be wired to accept single ended levels. The reference voltage $V_{REF} = V_{DD}/2$ is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin.

The ratio of R1 and R2 might need to be adjusted to position the V_{REF} in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and $V_{DD} = 3.3V$, V_{REF} should be 1.25V and $R2/R1 = 0.609$.

SCHEMATIC EXAMPLE

Figure 2 shows a schematic example of 85211I-01. In this example, the input is driven by an ICS HiPerClockS HSTL driver. The decoupling capacitors should be physically located near

the power pin. For 85211I-01, the unused outputs need to be terminated.

RECOMMENDATIONS FOR UNUSED OUTPUT PINS

OUTPUTS:

HSTL OUTPUT

All unused HSTL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

CLOCK INPUT INTERFACE

The CLK /nCLK accepts differential input signals of both V_{SWING} and V_{OH} to meet the V_{PP} and V_{CMR} input requirements. *Figures 3A to 3D* show interface examples for the 852111-01 clock input driven by most common driver types. The input interfaces suggested here are examples only. Please consult with

the vendor of the driver components to confirm the driver termination requirement. For example in *Figure 3*, the input termination applies for HSTL drivers. If you are using an HSTL driver from another vendor, use their termination recommendation.

POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the 85211I-01. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the 85211I-01 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{DD} = 3.3V + 5\% = 3.465V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)_{MAX} = $V_{DD_MAX} * I_{DD_MAX} = 3.465V * 22mA = 76.2mW$
- Power (outputs)_{MAX} = **82.34mW/Loaded Output pair**
If all outputs are loaded, the total power is $2 * 82.34mW = 164.7mW$

Total Power_{MAX} (3.465V, with all outputs switching) = $76.2mW + 164.7mW = 240.9mW$

2. Junction Temperature.

Junction temperature, T_j, is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for the devices is 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_{total} = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 103.3°C/W per Table 6 below. Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 0.241\text{W} * 103.3^\circ\text{C/W} = 110^\circ\text{C}. \text{ This is well below the limit of } 125^\circ\text{C}.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

TABLE 6. THERMAL RESISTANCE θ_{JA} FOR 8-PIN SOIC, FORCED CONVECTION

θ_{JA} by Velocity (Linear Feet per Minute)			
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	153.3°C/W	128.5°C/W	115.5°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	112.7°C/W	103.3°C/W	97.1°C/W

NOTE: Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

HSTL output driver circuit and termination are shown in *Figure 4*.

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load.

Pd_H is power dissipation when the output drives high.
 Pd_L is the power dissipation when the output drives low.

$$Pd_H = (V_{OH_MAX} / R_L) * (V_{DD_MAX} - V_{OH_MAX})$$

$$Pd_L = (V_{OL_MAX} / R_L) * (V_{DD_MAX} - V_{OL_MAX})$$

$$Pd_H = (1.4V / 50\Omega) * (3.465V - 1.4V) = 57.82mW$$

$$Pd_L = (0.4V / 50\Omega) * (3.465V - 0.4V) = 24.52mW$$

Total Power Dissipation per output pair = Pd_H + Pd_L = **82.34mW**
