FEATURES

- 95 ps propagation delay
- 7.5 GHz toggle rate
- 60 ps typical output rise/fall
- 60 fs random jitter (RJ)
- On-chip terminations at both input pins
- Extended industrial temperature range: -40°C to $+125^{\circ}\text{C}$
- 2.5 V to 3.3 V power supply ($V_{CC} - V_{EE}$)

APPLICATIONS

- Clock and data signal restoration and level shifting
- Automated test equipment (ATE)
- High speed instrumentation
- High speed line receivers
- Threshold detection
- Converter clocking

GENERAL DESCRIPTION

The ADCLK905 (one input, one output), ADCLK907 (dual one input, one output), and ADCLK925 (one input, two outputs) are ultrafast clock/data buffers fabricated on the Analog Devices, Inc., proprietary XFCB3 silicon germanium (SiGe) bipolar process.

The ADCLK905/ADCLK907/ADCLK925 feature full-swing emitter coupled logic (ECL) output drivers. For PECL (positive ECL) operation, bias V_{CC} to the positive supply and V_{EE} to ground. For NECL (negative ECL) operation, bias V_{CC} to ground and V_{EE} to the negative supply.

The buffers offer 95 ps propagation delay, 7.5 GHz toggle rate, 10 Gbps data rate, and 60 fs random jitter (RJ).

The inputs have center tapped, $100\ \Omega$, on-chip termination resistors. A V_{REF} pin is available for biasing ac-coupled inputs.

The ECL output stages are designed to directly drive 800 mV each side into $50\ \Omega$ terminated to $V_{CC} - 2\ \text{V}$ for a total differential output swing of 1.6 V.

The ADCLK905/ADCLK907/ADCLK925 are available in 16-lead LFCSP packages.

ELECTRICAL CHARACTERISTICS

Typical (Typ) values are given for $V_{CC} - V_{EE} = 3.3\text{ V}$ and $T_A = 25^\circ\text{C}$, unless otherwise noted. Minimum (Min) and maximum (Max) values are given over the full $V_{CC} - V_{EE} = 3.3\text{ V} \pm 10\%$ and $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$ variation, unless otherwise noted.

Table 1.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
DC INPUT CHARACTERISTICS						
Input Voltage High Level	V_{IH}	$V_{EE} + 1.6$		V_{CC}	V	
Input Voltage Low Level	V_{IL}	V_{EE}		$V_{CC} - 0.7$	V	
Input Differential Range	V_{ID}	0.2		3.4	V p-p	-40°C to $+85^\circ\text{C}$ ($\pm 1.7\text{ V}$ between input pins)
	V_{ID}	0.2		2.8	V p-p	85°C to 125°C ($\pm 1.4\text{ V}$ between input pins)
Input Capacitance	C_{IN}		0.4		pF	
Input Resistance, Single-Ended Mode			50		Ω	
Input Resistance, Differential Mode			100		Ω	
Input Resistance, Common Mode			50		k Ω	Open V_T
Input Bias Current			20		μA	
DC OUTPUT CHARACTERISTICS						
Output Voltage High Level	V_{OH}	$V_{CC} - 1.26$		$V_{CC} - 0.76$	V	$50\ \Omega$ to $(V_{CC} - 2.0\text{ V})$
Output Voltage Low Level	V_{OL}	$V_{CC} - 1.99$		$V_{CC} - 1.54$	V	$50\ \Omega$ to $(V_{CC} - 2.0\text{ V})$
Output Voltage Differential	V_{OD}	610		1040	mV	$50\ \Omega$ to $(V_{CC} - 2.0\text{ V})$
Reference Voltage	V_{REF}					
Output Voltage			$(V_{CC} + 1)/2$		V	$-500\ \mu\text{A}$ to $+500\ \mu\text{A}$

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Supply Voltage $V_{CC} - V_{EE}$	6.0V
Input Voltage D (D1, D2), \overline{D} ($\overline{D1}$, $\overline{D2}$)	$V_{EE} - 0.5\text{ V}$ to $V_{CC} + 0.5\text{ V}$
D1, D2, $\overline{D1}$, $\overline{D2}$ to V_T Pin (CML or PECL Termination)	$\pm 40\text{ mA}$
D (D1, D2) to \overline{D} ($\overline{D1}$, $\overline{D2}$)	$\pm 1.8\text{ V}$
Maximum Voltage on Output Pins	$V_{CC} + 0.5\text{ V}$
Maximum Output Current	35 mA
Input Termination, V_T to D (D1, D2), \overline{D} ($\overline{D1}$, $\overline{D2}$)	$\pm 2\text{ V}$
Voltage Reference, V_{REF}	$V_{CC} - V_{EE}$
Temperature	
Operating Temperature Range, Ambient	-40°C to $+125^\circ\text{C}$
Operating Temperature, Junction	150°C
Storage Temperature Range	-65°C to $+150^\circ\text{C}$

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 3. Thermal Resistance

Package Type	θ_{JA}	Unit
16-Lead LFCSP	70	$^\circ\text{C}/\text{W}$

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

NOTES

1. NC = NO CONNECT. DO NOT CONNECT TO THIS PIN.
2. EXPOSED PAD. THE EXPOSED PAD IS NOT ELECTRICALLY CONNECTED TO ANY PART OF THE CIRCUIT. IT CAN BE LEFT FLOATING FOR OPTIMAL ELECTRICAL ISOLATION BETWEEN THE PACKAGE HANDLE AND THE SUBSTRATE OF THE DIE. IT CAN ALSO BE SOLDERED TO THE APPLICATION BOARD IF IMPROVED THERMAL AND/OR MECHANICAL STABILITY IS DESIRED. EXPOSED METAL AT THE CORNERS OF THE PACKAGE IS CONNECTED TO THIS EXPOSED PAD. ALLOW SUFFICIENT CLEARANCE TO VIAS AND OTHER COMPONENTS.

APPLICATIONS INFORMATION

POWER/GROUND LAYOUT AND BYPASSING

The ADCLK905/ADCLK907/ADCLK925 buffers are designed for very high speed applications. Consequently, high speed design techniques must be used to achieve the specified performance. It is critically important to use low impedance supply planes for both the negative supply (V_{EE}) and the positive supply (V_{CC}) planes as part of a multilayer board. Providing the lowest inductance return path for switching currents ensures the best possible performance in the target application.

It is also important to adequately bypass the input and output supplies. A 1 μF electrolytic bypass capacitor should be placed within several inches of each power supply pin to ground. In addition, multiple high quality 0.001 μF bypass capacitors should be placed as close as possible to each of the V_{EE} and V_{CC} supply pins and should be connected to the GND plane with redundant vias. High frequency bypass capacitors should be carefully selected for minimum inductance and ESR. Parasitic layout inductance should be strictly avoided to maximize the effectiveness of the bypass at high frequencies.

OUTPUT STAGES

The specified performance can be achieved only by using proper transmission line terminations. The outputs of the ADCLK905/ADCLK907/ADCLK925 buffers are designed to directly drive 800 mV into 50 Ω cable or microstrip/stripline transmission lines terminated with 50 Ω referenced to $V_{CC} - 2\text{ V}$. The PECL output stage is shown in Figure 25. The outputs are designed for best transmission line matching. If high speed signals must be routed more than a centimeter, either the microstrip or the stripline technique is required to ensure proper transition times and to prevent excessive output ringing and pulse width-dependent propagation delay dispersion.

Figure 25. Simplified Schematic Diagram of the ADCLK905/ADCLK907/ADCLK925 PECL Output Stage

OPTIMIZING HIGH SPEED PERFORMANCE

As with any high speed circuit, proper design and layout techniques are essential to obtaining the specified performance. Stray capacitance, inductance, inductive power and ground impedances, or other layout issues can severely limit performance and cause oscillation. Discontinuities along input and output transmission lines can also severely limit the specified jitter performance by reducing the effective input slew rate.

In a 50 Ω environment, input and output matching have a significant impact on performance. The buffer provides internal 50 Ω termination resistors for both D and \bar{D} inputs. The return side should normally be connected to the reference pin provided. The termination potential should be carefully bypassed, using ceramic capacitors to prevent undesired aberrations on the input signal due to parasitic inductance in the termination return path. If the inputs are directly coupled to a source, care must be taken to ensure the pins are within the rated input differential and common-mode ranges.

If the return is floated, the device exhibits 100 Ω cross termination, but the source must then control the common-mode voltage and supply the input bias currents.

There are ESD/clamp diodes between the input pins to prevent the application of excessive offsets to the input transistors. ESD diodes are not optimized for best ac performance. When a clamp is desired, it is recommended that appropriate external diodes be used.

BUFFER RANDOM JITTER

The ADCLK905/ADCLK907/ADCLK925 are specifically designed to minimize added random jitter over a wide input slew rate range. Provided sufficient voltage swing is present, random jitter is affected most by the slew rate of the input signal. Whenever possible, excessively large input signals should be clamped with fast Schottky diodes because attenuators reduce the slew rate. Input signal runs of more than a few centimeters should be over low loss dielectrics or cables with good high frequency characteristics.
