LOW PHASE NOISE CLOCK MULTIPLIER

ICS601-21

Description

The ICS601-21 is a low-cost, low phase noise, high performance clock synthesizer for applications which require low phase noise and low jitter. It is IDT's lowest phase noise multiplier. Using IDT's patented analog and digital Phase Locked Loop (PLL) techniques, the chip accepts a crystal or clock input, and produces output clocks up to 230 MHz at 3.3 V.

This product is intended for clock generation. It has low output jitter (variation in the output period), but input to output skew and jitter are not defined nor guaranteed.

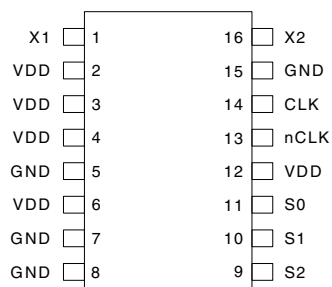

Features

- Fully integrated PLL, no external loop filter required
- Differential 3.3 V LVPECL outputs
- Uses fundamental crystal or clock
 - Crystal input frequency: 10 to 27MHz
 - Clock input: 10 to 38MHz (multiply by 6)
10 to 31MHz (all other multiply settings)
- Output clocks up to 230 MHz at 3.3 V
- Low phase noise: -122 dBc/Hz at 10 kHz
- Low jitter - 15 ps one sigma typ.
- Powerdown mode lowers power consumption
- Packaged in 16-pin TSSOP, Pb-free
- Advanced, low power, sub-micron CMOS process
- Operating voltage of 3.3 V
- Commercial temperature range available

Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	X1	XI	Crystal or clock input. Connect to a fundamental parallel mode crystal or clock input. See electrical tables for input frequency ranges.
2 - 4	VDD	Power	Connect to +3.3 V.
5	GND	Power	Connect to ground.
6	VDD	Power	Connect to +3.3 V.
7 - 8	GND	Power	Connect to ground.
9	S2	Input	Select pin 2. Internal pull-up resistor.
10	S1	Input	Select pin 1. Internal pull-up resistor.
11	S0	Input	Select pin 0. Internal pull-up resistor.
12	VDD	Power	Connect to +3.3 V.
13	nCLK	Output	Inverted differential clock output.
14	CLK	Output	Differential clock output.
15	GND	Power	Connect to ground.
16	X2	XO	Crystal connection. Connect to a fundamental parallel mode crystal or leave unconnected for clock input. See electrical tables for input frequency ranges.

External Components

The ICS601-21 requires a minimum number of external components for proper operation. Decoupling capacitors of 0.01 μF and 0.1 μF should be connected between VDD and GND, as close to the part as possible. A 50 Ω terminating resistor should be used on each clock output. (See termination diagram on page 5). The crystal must be connected as close to the chip as possible. The crystal should be fundamental mode, parallel resonant. Do not use third overtone. For exact tuning when using a crystal, capacitors should be connected from pins X1 to ground and X2 to ground. In general, the value of these capacitors is given by the following equation, where CL is the crystal load capacitance: Crystal caps (pF) = (CL-5) x 2. So for a crystal with 16 pF load capacitance, two 22 pF caps can be used. For any given board layout, IDT can measure the board capacitance and recommend the exact capacitance value to use.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the ICS601-21. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.
