5 V ECL ÷2, ÷4, ÷8 Clock Generation Chip

Description

The MC10/100EL34 is a low skew ÷2, ÷4, ÷8 clock generation chip designed explicitly for low skew clock generation applications. The internal dividers are synchronous to each other, therefore, the common output edges are all precisely aligned. The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

The common enable ($\overline{EN}$) is synchronous so that the internal dividers will only be enabled/disabled when the internal clock is already in the LOW state. This avoids any chance of generating a runt clock pulse on the internal clock when the device is enabled/disabled as can happen with an asynchronous control. An internal runt pulse could lead to losing synchronization between the internal divider stages. The internal enable flip−flop is clocked on the falling edge of the input clock, therefore, all associated specification limits are referenced to the negative edge of the clock input.

Upon startup, the internal flip-flops will attain a random state; the master reset (MR) input allows for the synchronization of the internal dividers, as well as multiple EL34s in a system.

The 100 Series contains temperature compensation.

Features

- 50 ps Output-to-Output Skew
- Synchronous Enable/Disable
- Master Reset for Synchronization
- PECL Mode Operating Range:
  - V_{CC} = 4.2 V to 5.7 V with V_{EE} = 0 V
- NECL Mode Operating Range:
  - V_{CC} = 0 V with V_{EE} = −4.2 V to −5.7 V
- Internal Input 75 kΩ Pulldown Resistors on CLK(s), $\overline{EN}$, and MR
- These Devices are Pb-Free, Halogen Free and are RoHS Compliant

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

1. Input and output parameters vary 1:1 with V_{CC}. V_{EE} can vary +0.06 V / −0.5 V.
2. Outputs are terminated through a 50 Ω resistor to V_{CC} − 2.0 V.
3. V_{IHCMR} min varies 1:1 with V_{EE}, V_{IHCMR} max varies 1:1 with V_{CC}. The V_{IHCMR} range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between V_{PP}min and 1 V.

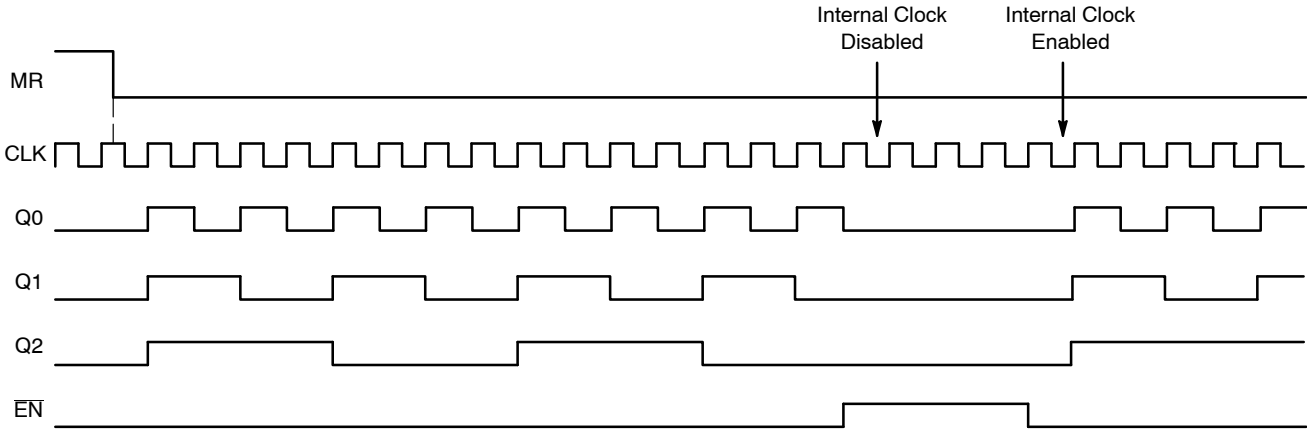
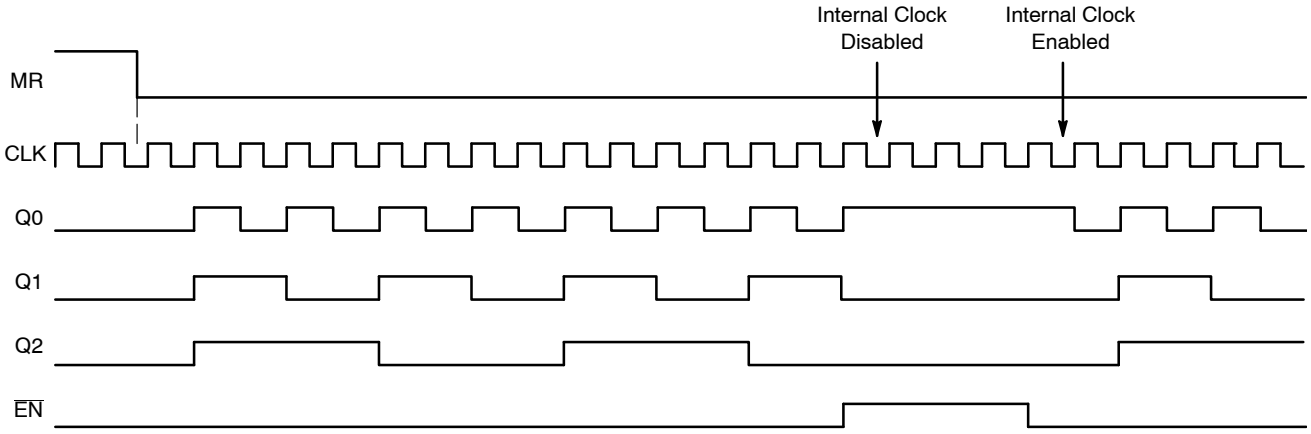
1. 10 Series: V_{EE} can vary +0.06 V / −0.5 V.
   100 Series: V_{EE} can vary +0.8 V / −0.5 V.
2. Within-device skew is defined as identical transitions on similar paths through a device.
3. V_{PP}min is minimum input swing for which AC parameters guaranteed. The device has a DC gain of ≈40.

There are two distinct functional relationships between the Master Reset and Clock:



CASE 1: If the MR is De-asserted (H−L), While the Clock is Still High, the Outputs will Follow the First Ensuing Clock Rising Edge.



CASE 2: If the MR is De−asserted (H−L), After the Clock has Transitioned Low, the Outputs will Follow the Second Ensuing Clock Rising Edge.

Figure 2. Timing Diagrams

The $\overline{EN}$ signal will “freeze” the internal divider flip−flops on the first falling edge of CLK after its assertion. The internal divider flip−flops will maintain their state during the freeze. The $\overline{EN}$ is deasserted (LOW), and after the next falling edge of CLK, then the internal divider flip−flops will “unfreeze” and continue to their next state count with proper phase relationships.
