GENERAL DESCRIPTION

The 8731-01 is a low voltage, low skew, 1-to-11 Differential-to-3.3V LVPECL Clock Multiplier/Zero Delay Buffer. With output frequencies up to 700MHz the 8731-01 is targeted at high performance clock applications. Along with a fully integrated PLL the 8731-01 contains frequency configurable, differential outputs and external feedback inputs for multiplying clock frequencies and regenerating clocks with “zero delay”. Frequency multiplication is achieved by utilizing the separate feedback and clock output dividers. The value of the multiplier is determined by the ratio of the feedback divider, M, to the output divider, N. For multiplier values greater than 1, M must be greater than N. For multiplier values less than 1, M must be less than N. The zero delay mode is achieved with M and N at equal values. The divide values of the clock and feedback outputs are controlled by the DIV_SEL0:2 and FB_SEL0:1 inputs, respectively. The 8731-01 accepts any differential signal and translates it to differential 3.3V LVPECL output levels.

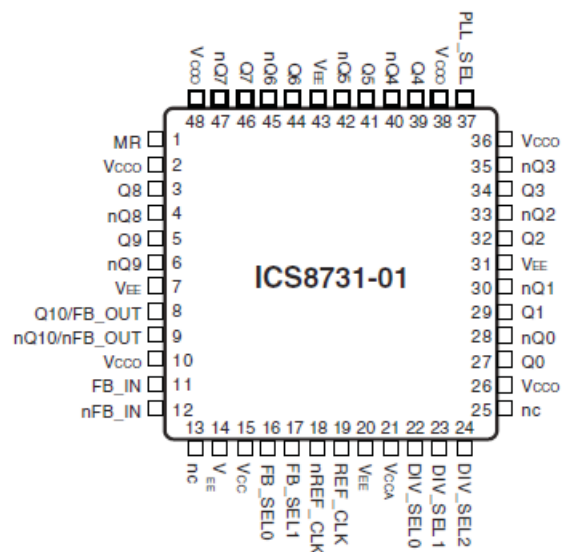

FEATURES

- Eleven differential 3.3V LVPECL outputs
- Differential reference clock input pair
- REF_CLK, nREF_CLK pair can accept the following differential input levels: LVPECL, LVDS, LVHSTL, SSTL, HCSL
- Maximum output frequency: 700MHz
- Maximum reference clock input frequency: 200MHz
- VCO range: 250MHz - 700MHz
- Accepts any single-ended input signal with a resistor bias on nCLK input
- External feedback for zero delay capability
- Output skew: 70ps (maximum)
- Cycle-to-cycle jitter: 65ps (maximum)
- Full 3.3V operating supply
- 0°C to 70°C ambient operating temperature
- Available in lead-free RoHS compliant package

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1	MR	Input	Pulldown	Active High Master Reset. When logic HIGH, the internal dividers are reset causing the true outputs, Qx, to go low and the inverted outputs nQx to go high. When logic LOW, the internal dividers and the outputs are enabled. LVCMOS / LVTTTL interface levels.
2, 10, 26, 36, 38, 48	V _{CCO}	Power		Output supply pins.
3, 4, 5, 6	Q8, nQ8, Q9, nQ9	Output		Differential output pairs.
7, 14, 20, 31, 43	V _{EE}	Power		Negative supply pins.
8, 9	Q10/FB_OUT, nQ10/nFB_OUT	Output		Differential clock outputs.
11, 12	FB_IN, nFB_IN	Input	Pulldown	Feedback input to phase detector for generating clocks with “zero delay”.
15	V _{CC}	Power		Core supply pin.
16	FB_SELO	Input	Pulldown	Determines output divider for Q10/FB outputs (see Table 3). LVCMOS / LVTTTL interface levels.
17	FB_SEL1	Input	Pulldown	Determines output divider for Q10/FB outputs (see Table 3). LVCMOS / LVTTTL interface levels.
18	nREF_CLK	Input	Pullup	Inverting differential clock input.
19	REF_CLK	Input	Pulldown	Non-inverting differential clock input.
21	V _{CCA}	Power		Analog supply pin.
22	DIV_SELO,	Input	Pulldown	Determines output divider values in Table 3. LVCMOS / LVTTTL interface levels.
23	DIV_SEL1	Input	Pulldown	Determines output divider values in Table 3. LVCMOS / LVTTTL interface levels.
24	DIV_SEL2	Input	Pulldown	Determines output divider values in Table 3. LVCMOS / LVTTTL interface levels.
13, 25	nc	Unused		No connect.
27, 28, 29, 30	Q0, nQ0, Q1, nQ1	Output		Differential output pairs.
32, 33, 34, 35	Q2, nQ2, Q3, nQ3	Output		Differential output pairs.
37	PLL_SEL	Input	Pullup	Selects between the PLL and reference clock as the input to the dividers. When LOW, selects reference clock. When HIGH, selects PLL. LVCMOS / LVTTTL interface levels.
39, 40, 41, 42	Q4, nQ4, Q5, nQ5	Output		Differential output pairs.
44, 45, 46, 47	Q6, nQ6, Q7, nQ7	Output		Differential output pairs.

NOTE: and refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

APPLICATION INFORMATION

POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The 8731-01 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{CC} , V_{CCA} , and V_{CCO} should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 1* illustrates how a 10Ω resistor along with a $10\mu\text{F}$ and a $.01\mu\text{F}$ bypass capacitor should be connected to each V_{CCA} pin.

FIGURE 1. POWER SUPPLY FILTERING

WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 2 shows how the differential input can be wired to accept single ended levels. The reference voltage $V_{REF} = V_{CC}/2$ is generated by the bias resistors $R1$, $R2$ and $C1$. This bias circuit should be located as close as possible to the input pin. The ratio

of $R1$ and $R2$ might need to be adjusted to position the V_{REF} in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and $V_{CC} = 3.3\text{V}$, V_{REF} should be 1.25V and $R2/R1 = 0.609$.

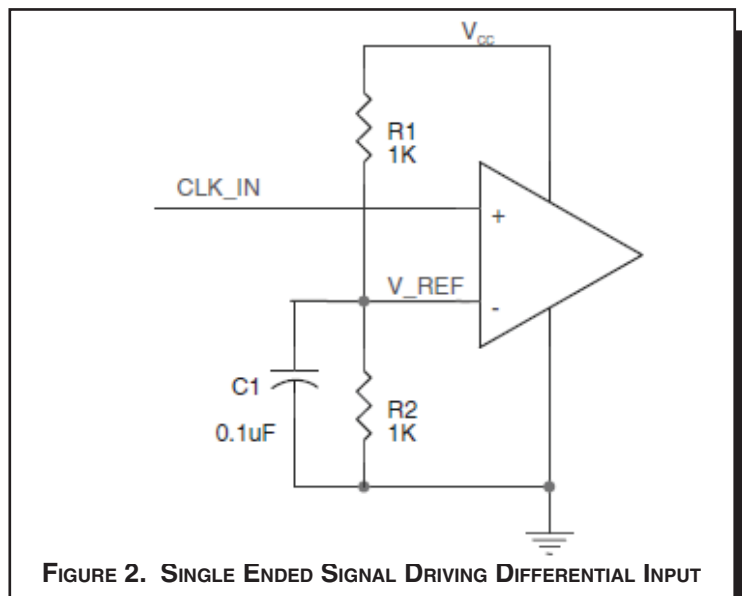

FIGURE 2. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

DIFFERENTIAL CLOCK INPUT INTERFACE

The REF_CLK /nREF_CLK accepts LVDS, LVPECL, LVHSTL, SSTL, HCSL and other differential signals. Both V_{SWING} and V_{OH} must meet the V_{PP} and V_{CMR} input requirements. Figures 3A to 3D show interface examples for the REF_CLK/nREF_CLK input driven by the most common driver types. The input interfaces suggested here are examples

only. Please consult with the vendor of the driver component to confirm the driver termination requirements. For example in *Figure 3A*, the input termination applies for LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

FIGURE 3A. REF_CLK/nREF_CLK INPUT DRIVEN BY LVHSTL DRIVER

FIGURE 3B. REF_CLK/nREF_CLK INPUT DRIVEN BY 3.3V LVPECL DRIVER

FIGURE 3C. REF_CLK/nREF_CLK INPUT DRIVEN BY 3.3V LVPECL DRIVER

FIGURE 3D. REF_CLK/nREF_CLK INPUT DRIVEN BY 3.3V LVDS DRIVER

RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

INPUTS:

LVC MOS CONTROL PINS:

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

OUTPUTS:

LVPECL OUTPUT

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

TERMINATION FOR LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to

drive 50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 4A and 4B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 4A. LVPECL OUTPUT TERMINATION

FIGURE 4B. LVPECL OUTPUT TERMINATION

SCHEMATIC EXAMPLE

Figure 5 shows an application schematic example of the 8731-01. This schematic provides examples of input and output handling. The input can accept various types of differential signal. This example shows the 8731-01 input driven by a 3.3V LVPECL driver. Additional examples for the input driven by other types of drivers are shown in the application section of

this data sheet. The 8731-01 outputs are LVPECL driver. In this example, we assume the traces are long transmission line and the receiver is high input impedance without built-in matched load. An example of 3.3V LVPECL termination is shown in this schematic. Additional termination approaches are shown in the LVPECL Termination Application Note.

FIGURE 5. APPLICATION SCHEMATIC EXAMPLE

POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the 8731-01. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the 8731-01 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{CC} = 3.3V + 5\% = 3.465V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)_{MAX} = $V_{CC_MAX} * I_{EE_MAX} = 3.465V * 195mA = 675.67mW$
- Power (outputs)_{MAX} = **30mW/Loaded Output pair**
If all outputs are loaded, the total power is $11 * 30mW = 330mW$

$$\text{Total Power}_{MAX} (3.465V, \text{ with all outputs switching}) = 675.67mW + 330mW = 1005.67mW$$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for the devices is 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 42.1°C/W per Table 7 below.

Therefore, T_j for an ambient temperature of 70°C with all outputs switching is:

$$70^\circ C + 1.006W * 42.1^\circ C/W = 112.4^\circ C. \text{ This is below the limit of } 125^\circ C.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

TABLE 7. THERMAL RESISTANCE θ_{JA} FOR 48-PIN LQFP, FORCED CONVECTION

θ_{JA} by Velocity (Linear Feet per Minute)			
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	67.8°C/W	55.9°C/W	50.1°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	47.9°C/W	42.1°C/W	39.4°C/W

NOTE: Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 6*.

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of $V_{CCO} - 2V$.

- For logic high, $V_{OUT} = V_{OH_MAX} = V_{CCO_MAX} - 0.9V$
 $(V_{CCO_MAX} - V_{OH_MAX}) = 0.9V$
- For logic low, $V_{OUT} = V_{OL_MAX} = V_{CCO_MAX} - 1.7V$
 $(V_{CCO_MAX} - V_{OL_MAX}) = 1.7V$

Pd_H is power dissipation when the output drives high.
 Pd_L is the power dissipation when the output drives low.

$$Pd_H = [(V_{OH_MAX} - (V_{CC_MAX} - 2V))/R_L] * (V_{CC_MAX} - V_{OH_MAX}) = [(2V - (V_{CC} - V_{OH_MAX}))/R_L] * (V_{CC} - V_{OH_MAX}) = [(2V - 0.9V)/50\Omega] * 0.9V = \mathbf{19.8mW}$$

$$Pd_L = [(V_{OL_MAX} - (V_{CC_MAX} - 2V))/R_L] * (V_{CC_MAX} - V_{OL_MAX}) = [(2V - (V_{CC} - V_{OL_MAX}))/R_L] * (V_{CC} - V_{OL_MAX}) = [(2V - 1.7V)/50\Omega] * 1.7V = \mathbf{10.2mW}$$

Total Power Dissipation per output pair = $Pd_H + Pd_L = \mathbf{30mW}$
