### DESCRIPTION

The DS1004 is a 5-tap all silicon delay line which can provide 2, 3, 4, or 5 ns tap-to-tap delays within a standard part family. The device is Dallas Semiconductor's fastest 5-tap delay line. It is available in a standard 8-pin DIP and 150 mil 8-pin mini-SOIC. The device features precise leading and trailing edge accuracies and has the inherent reliability of an all-silicon delay line solution.

The DS1004 is specified for tap-to-tap tolerances as shown in Table 1. Each device has a minimum input-to-tap 1 delay of 5 ns. Subsequent taps (taps 2 through 5) are precisely delayed by 2, 3, 4, or 5 ns. See Table 1 for details. Input to Tap Tolerance over temperature and voltage is  $\pm 1.5$  ns in addition to the nominal delay tolerance. Nominal tap-to-tap tolerances range from  $\pm 0.75$  ns to  $\pm 1.0$  ns. Each output is capable of driving up to 10 LS loads.

For customers needing non-standard delay values, the Late Package Program (LPP) is available. Customers may contact Dallas Semiconductor at (972) 371-4348 for further details.

**DS1004 TEST CIRCUIT Figure 1****TEST SETUP DESCRIPTION**

Figure 1 illustrates the hardware configuration used for measuring the timing parameters of the DS1004. The input waveform is produced by a precision pulse generator under software control. Time delays are measured by a time interval counter (20 ps resolution) connected to the output. The DS1004 output taps are selected and connected to the interval counter by a VHF switch control unit. All measurements are fully automated with each instrument controlled by the computer over an IEEE 488 bus.
