## Single Digitally-Controlled (XDCP ${ }^{\text {TM }}$ ) Potentiometer

The X9279 integrates a single digitally controlled potentiometer (XDCP) on a monolithic CMOS integrated circuit.

The digital controlled potentiometer is implemented using 255 resistive elements in a series array. Between each element are tap points connected to the wiper terminal through switches. The position of the wiper on the array is controlled by the user through the 2-Wire bus interface. The potentiometer has associated with it a volatile Wiper Counter Register (WCR) and a four non-volatile Data Registers that can be directly written to and read by the user. The contents of the WCR controls the position of the wiper on the resistor array though the switches. Power-up recalls the contents of the default data register (DR0) to the WCR.

The XDCP can be used as a three-terminal potentiometer or as a two terminal variable resistor in a wide variety of applications including control, parameter adjustments, and signal processing.

## Features

- 256 Resistor Taps
- 2-Wire Serial Interface for Write, Read, and Transfer Operations of the Potentiometer
- Wiper Resistance, $100 \Omega$ Typical @ 5V
- 16 Non-volatile Data Registers for Each Potentiometer
- Non-volatile Storage of Multiple Wiper Positions
- Power-on Recall. Loads Saved Wiper Position on Power-up.
- Standby Current < $5 \mu \mathrm{~A}$ Max
- $\mathrm{V}_{\mathrm{CC}}$ : 2.7 V to 5.5 V Operation
- $50 \mathrm{k} \Omega, 100 \mathrm{k} \Omega$ Versions of End-to-End Resistance
- Endurance: 100,000 Data Changes per Bit per Register
- 100 yr. Data Retention
- 14 Ld TSSOP
- Low Power CMOS
- Pb-Free Available (RoHS Compliant)

*Add "-T" suffix for tape and reel. Please refer to TB347 for details on reel specifications.
NOTES:

1. These Intersil Pb-free plastic packaged products employ special Pb -free material sets, molding compounds/die attach materials, and $100 \%$ matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations). Intersil Pb -free products are MSL classified at Pb -free peak reflow temperatures that meet or exceed the Pb -free requirements of IPC/JEDEC J STD-020.
2. Not recommended for new designs.

## Detailed Functional Diagram

## Circuit Level Applications

- Vary the gain of a voltage amplifier
- Provide programmable DC reference voltages for comparators and detectors
- Control the volume in audio circuits
- Trim out the offset voltage error in a voltage amplifier circuit
- Set the output voltage of a voltage regulator
- Trim the resistance in Wheatstone bridge circuits
- Control the gain, characteristic frequency and Q-factor in filter circuits
- Set the scale factor and zero point in sensor signal conditioning circuits
- Vary the frequency and duty cycle of timer ICs
- Vary the DC biasing of a pin diode attenuator in RF circuits
- Provide a control variable (I, V, or R) in feedback circuits

## System Level Applications

- Adjust the contrast in LCD displays
- Control the power level of LED transmitters in communication systems
- Set and regulate the DC biasing point in an RF power amplifier in wireless systems
- Control the gain in audio and home entertainment systems
- Provide the variable DC bias for tuners in RF wireless systems
- Set the operating points in temperature control systems
- Control the operating point for sensors in industrial systems
- Trim offset and gain errors in artificial intelligent systems

## Pin Descriptions

## Bus Interface Pins

## SERIAL DATA INPUT/OUTPUT (SDA)

The SDA is a bidirectional serial data input/output pin for a 2-Wire slave device and is used to transfer data into and out of the device. It receives device address, opcode, wiper register address and data sent from an 2-Wire master at the rising edge of the serial clock SCL, and it shifts out data after each falling edge of the serial clock SCL.

It is an open drain output and may be wire-ORed with any number of open drain or open collector outputs. An open drain output requires the use of a pull-up resistor. For selecting typical values, refer to the guidelines for calculating typical values on the bus pull-up resistors graph.

## SERIAL CLOCK (SCL)

This input is used by 2-Wire master to supply 2 -Wire serial clock to the X9279.

## DEVICE ADDRESS (A3 - A0)

The Address inputs A2-A0 are used to set the least significant 3 bits of the 8 -bit slave address, address pin A3 must be
connected to ground for proper operation. A match in the slave address serial data stream must be made with the Address input in order to initiate communication with the X9279. A maximum of 8 devices may occupy the 2 -Wire serial bus.

## Potentiometer Pins

## $\mathbf{R}_{\mathbf{H}}, \mathbf{R}_{\mathrm{L}}$

The $R_{H}$ and $R_{L}$ pins are equivalent to the terminal connections on a mechanical potentiometer.

## RW

The wiper pin is equivalent to the wiper terminal of a mechanical potentiometer.

## Bias Supply Pins

## SYSTEM SUPPLY VOLTAGE ( $\mathbf{V}_{\mathrm{C}}$ ) AND SUPPLY GROUND ( $V_{\mathbf{s s}}$ )

The $\mathrm{V}_{\mathrm{CC}}$ pin is the system supply voltage. The $\mathrm{V}_{\mathrm{SS}}$ pin is the system ground.

## Other Pins

## NO CONNECT

No connect pins should be left open. This pins are used for Intersil manufacturing and testing purposes.

## HARDWARE WRITE PROTECT INPUT (WP)

The $\overline{\mathrm{WP}}$ pin when LOW prevents non-volatile writes to the Data Registers.

## Principles Of Operation

The X9279 is a integrated microcircuit incorporating a resistor array and associated registers and counter and the serial interface logic providing direct communication between the host and the digitally controlled potentiometers. This section provides detail description of the following:

## - Resistor Array Description

- Serial Interface Description
- Instruction and Register Description

## Array Description

The X9279 is comprised of a resistor array (see Figure 1). The array contains, in effect, 255 discrete resistive segments that are connected in series. The physical ends of each array are equivalent to the fixed terminals of a mechanical potentiometer ( $\mathrm{R}_{\mathrm{H}}$ and $\mathrm{R}_{\mathrm{L}}$ inputs).

At both ends of each array and between each resistor segment is a CMOS switch connected to the wiper ( $\mathrm{R}_{\mathrm{W}}$ ) output. Within each individual array only one switch may be turned on at a time.

These switches are controlled by a Wiper Counter Register (WCR). The 8-bits of the WCR (WCR[7:0]) are decoded to select, and enable, one of 256 switches (see Table 1).

The WCR may be written directly. These Data Registers can the WCR can be read and written by the host system.

FIGURE 1. DETAILED POTENTIOMETER BLOCK DIAGRAM

## Power-up and Down Recommendations.

There are no restrictions on the power-up or power-down conditions of $\mathrm{V}_{\mathrm{CC}}$ and the voltages applied to the potentiometer pins provided that $\mathrm{V}_{\mathrm{CC}}$ is always more positive than or equal to $\mathrm{V}_{\mathrm{H}}, \mathrm{V}_{\mathrm{L}}$, and $\mathrm{V}_{\mathrm{W}}$, i.e., $\mathrm{V}_{\mathrm{CC}} \geq \mathrm{V}_{\mathrm{H}}, \mathrm{V}_{\mathrm{L}}$, $\mathrm{V}_{\mathrm{W}}$. The $\mathrm{V}_{\mathrm{CC}}$ ramp rate specification is always in effect.

## Serial Interface Description

## Serial Interface

The X9279 supports a bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master will always initiate data transfers and provide the clock for both transmit and receive operations. Therefore, the X9279 will be considered a slave device in all applications.

## Clock and Data Conventions

Data states on the SDA line can change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating start and stop conditions (see
Figure 2.

## Start Condition

All commands to the X9279 are preceded by the start condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The X9279 continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition is met (see Figure 2).

## Stop Condition

All communications must be terminated by a stop condition, which is a LOW to HIGH transition of SDA while SCL is HIGH (see Figure 2).

## Acknowledge

Acknowledge is a software convention used to provide a positive handshake between the master and slave devices on the bus to indicate the successful receipt of data. The transmitting device, either the master or the slave, will release the SDA bus after transmitting eight bits. The master generates a ninth clock cycle and during this period the receiver pulls the SDA line LOW to acknowledge that it successfully received the eight bits of data.

The X9279 will respond with an acknowledge after recognition of a start condition and its slave address and once again after successful receipt of the command byte. If the command is followed by a data byte the X9279 will respond with a final acknowledge (see Figure 2).

FIGURE 2. ACKNOWLEGE RESPONSE FROM RECEIVER

## Acknowledge Polling

The disabling of the inputs, during the internal non-volatile write operation, can be used to take advantage of the typical 5 ms EEPROM write cycle time. Once the stop condition is issued to indicate the end of the non-volatile write command the X9279 initiates the internal write cycle. ACK Polling Sequence, Flow 1, can be initiated immediately. This involves issuing the start condition followed by the device slave address. If the X9279 is still busy with the write operation no ACK will be returned. If the X9279 has completed the write operation an ACK will be returned and the master can then proceed with the next operation.

Flow 1: ACK Polling Sequence

## Instruction and Register Description

Device Addressing: Identification Byte (ID and A)
The first byte sent to the X9279 from the host, following a $\overline{\mathrm{CS}}$ going HIGH to LOW, is called the Identification byte. The most significant four bits of the slave address are a device type identifier. The ID[3:0] bits is the device ID for the X9279; this is fixed as 0101[B] (refer to Table 3).

The $A[2: 0]$ bits in the ID byte is the internal slave address. The physical device address is defined by the state of the A2 - A0 input pins. The slave address is externally specified by the user. The X9279 compares the serial data stream with the address input state; a successful compare of both address bits is required for the X9279 to successfully continue the command sequence. Only the device which slave address matches the incoming device address sent by the master executes the instruction. The A2-A0 inputs can be actively driven by CMOS input signals or tied to $\mathrm{V}_{\mathrm{CC}}$ or VSS.

## Instruction Byte (I)

The next byte sent to the X9279 contains the instruction and register pointer information. The three most significant bits are used provide the instruction opcode I [2:0]. The RB and RA bits point to one of the four Data Registers. P0 is the POT selection; since the X 9279 is single POT, the $\mathrm{PO}=0$. The format is shown in Table 4.

## Register Bank Selection (RB, RA, P1, P0)

There are 16 registers organized into four banks. Bank 0 is the default bank of registers. Only Bank 0 registers can be used for Data Register to Wiper Counter Register operations.

Banks 1, 2, and 3 are additional banks of registers (12 total) that can be used for 2-Wire write and read operations. The Data Registers in Banks 1, 2, and 3 cannot be used for direct read/write operations between the Wiper Counter Register.

## Device Description

## Wiper Counter Register (WCR)

The X9279 contains a Wiper Counter Register, for the DCP potentiometer. The Wiper Counter Register can be envisioned as a 8-bit parallel and serial load counter with its outputs decoded to select one of 256 switches along its resistor array. The contents of the WCR can be altered in four ways: it may be written directly by the host via the Write Wiper Counter Register instruction (serial load); it may be written indirectly by transferring the contents of one of four associated data registers via the XFR Data Register instruction (parallel load); it can be modified one step at a time by the Increment/Decrement instruction (see "Instruction Format" on page 10 for more details). Finally, it is loaded with the contents of its Data Register zero (DRO) upon power-up.

The Wiper Counter Register is a volatile register; that is, its contents are lost when the X9279 is powered-down.
Although the register is automatically loaded with the value in DR0 upon power-up, this may be different from the value present at power-down. Power-up guidelines are recommended to ensure proper loadings of the DR0 value into the WCR. The DRO value of Bank 0 is the default value.

## Data Registers (DR)

The potentiometer has four 8-bit non-volatile Data Registers (DR3-DR0). These can be read or written directly by the host. Data can also be transferred between any of the four Data Registers and the associated Wiper Counter Register. All operations changing data in one of the Data Registers is a non-volatile operation and will take a maximum of 10 ms .

If the application does not require storage of multiple settings for the potentiometer, the Data Registers can be used as regular memory locations for system parameters or user preference data.

Bit [7:0] are used to store one of the 256 wiper positions (0~255).

## Instructions

Four of the seven instructions are three bytes in length.
These instructions are:

- Read Wiper Counter Register - read the current wiper position of the potentiometer,
- Write Wiper Counter Register - change current wiper position of the potentiometer,
- Read Data Register - read the contents of the selected Data Register;
- Write Data Register - write a new value to the selected Data Register.

The basic sequence of the three byte instructions is illustrated in Figure 4. These three-byte instructions exchange data between the WCR and one of the Data Registers. A transfer from a Data Register to a WCR is essentially a write to a static RAM, with the static RAM controlling the wiper position. The response of the wiper to this action will be delayed by $t_{\text {WRL }}$. A transfer from the WCR (current wiper position), to a Data Register is a write to non-volatile memory and takes a minimum of $t_{W R}$ to complete. The transfer can occur between the potentiometer and one of its four associated registers (Bank 0).

Two instructions require a two-byte sequence to complete. These instructions transfer data between the host and the X9279; either between the host and one of the data registers or directly between the host and the Wiper Counter Register. These instructions are:

- XFR Data Register to Wiper Counter Register - This transfers the contents of one specified Data Register to the Wiper Counter Register.
- XFR Wiper Counter Register to Data Register - This transfers the contents of the Wiper Counter Register to the specified Data Register.
The final command is Increment/Decrement (Figures 5 and 6). The Increment/Decrement command is different from the other commands. Once the command is issued and the X9279 has responded with an acknowledge, the master can clock the selected wiper up and/or down in one segment steps; thereby, providing a fine tuning capability to the host. For each SCL clock pulse (tHIGH) while SDA is HIGH, the selected wiper will move one resistor segment towards the $\mathrm{R}_{\mathrm{H}}$ terminal. Similarly, for each SCL clock pulse while SDA is LOW, the selected wiper will move one resistor segment towards the $R_{L}$ terminal. See "Instruction Format" on page 10 for more details.

| S | Device Type Identifier |  |  |  | Device Addresses |  |  |  | S | Instruction Opcode |  |  |  | DR/Bank <br> Addresses |  |  |  | S | S |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A R T | 0 | 1 | 0 | 1 | 0 | A 2 | A 1 | A 0 | $\begin{aligned} & \text { A } \\ & \text { C } \\ & \text { K } \end{aligned}$ | 1 | 1 | 0 | 1 | RB | RA | 0 | 0 | A C K | T <br>  |

Increment/Decrement Wiper Counter Register (WCR)

| $\begin{aligned} & \mathrm{S} \\ & \mathrm{~T} \end{aligned}$ | Device Type Identifier |  |  |  | Device Addresses |  |  |  | A | Instruction Opcode |  |  |  | DR/Bank <br> Addresses |  |  |  | SACK | Increment/Decrement (Sent by Master on SDA) |  |  |  |  |  |  |  | S |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \mathrm{A} \\ & \mathrm{R} \\ & \mathrm{~T} \end{aligned}$ | 0 | 1 | 0 | 1 | 0 | A 2 | A 1 | A 0 | A C K | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |  | I/D | I/D |  |  |  | . | I/D | I/D | T O P |

NOTES:
4. "MACK"/"SACK": stands for the acknowledge sent by the master/slave.
5. "A3 ~ AO": stands for the device addresses sent by the master.
6. " X ": indicates that it is a " 0 " for testing purpose but physically it is a "don't care" condition.
7. "I": stands for the increment operation, SDA held high during active SCL phase (high).
8. "D": stands for the decrement operation, SDA held low during active SCL phase (high).

| Absolute Maximum Ratings |  |
| :---: | :---: |
| Voltage on SCL, SDA any Address Input with respect to VSS | -1 V to +7 V |
| $\mathrm{DV}=\|(\mathrm{VH}-\mathrm{VL})\|$. | 5.5 V |
| IW (10s) | $\pm 6 \mathrm{~mA}$ |

## Operating Conditions

## Thermal Information

| Thermal Resistance (Typical, Note 9) | $\theta_{\mathrm{JA}}\left({ }^{\circ} \mathrm{C} / \mathrm{W}\right)$ |
| :---: | :---: |
| 14 Lead TSSOP | 90 |
| Temperature Under Bias | . $-65^{\circ} \mathrm{C}$ to $+135^{\circ} \mathrm{C}$ |
| Storage Temperature | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Pb-Free Reflow Profile. | . .see link below |

| Temperature Range |  |
| :---: | :---: |
| Commercial | 0 to $+70^{\circ} \mathrm{C}$ |
| Industrial | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Supply Voltage VCC Limits (Note 13) |  |
| X9279 | $5 \mathrm{~V} \pm 10 \%$ |
| X9279-2.7. | 2.7V to 5.5V |
| Wiper Max Current ( $\mathrm{l}_{\mathrm{W}}$ ) | $\pm 3 \mathrm{~mA}$ |
| Power Rating @ +25 ${ }^{\circ} \mathrm{C}$, each pot | . 50 mW |

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTE:
9. $\theta_{\mathrm{JA}}$ is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.

Analog Characteristics Operating Conditions over recommended industrial (2.7V) unless otherwise specified.

| SYMBOL | PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNITS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{R}_{\text {TOTAL }}$ | End-to-End Resistance | T version |  | 100 |  | $\mathrm{k} \Omega$ |
| $\mathrm{R}_{\text {TOTAL }}$ | End-to-End Resistance | U version |  | 50 |  | $\mathrm{k} \Omega$ |
|  | End-to-End Resistance Tolerance |  |  |  | $\pm 20$ | \% |
| $\mathrm{R}_{\mathrm{W}}$ | Wiper Resistance @ V = 3V | $\mathrm{I}_{\mathrm{W}}=\left(\mathrm{V}_{\mathrm{RH}}-\mathrm{V}_{\mathrm{RL}}\right) / \mathrm{R}_{\text {TOTAL }}$ |  |  | 300 | $\Omega$ |
| $\mathrm{R}_{\mathrm{W}}$ | Wiper Resistance @ V = 5V | $\mathrm{I}_{\mathrm{W}}=\left(\mathrm{V}_{\mathrm{RH}}-\mathrm{V}_{\mathrm{RL}}\right) / \mathrm{R}_{\text {TOTAL }}$ |  |  | 150 | $\Omega$ |
| $\mathrm{V}_{\text {TERM }}$ | Voltage on any $\mathrm{R}_{\mathrm{H}}$ or $\mathrm{R}_{\mathrm{L}}$ Pin | $\mathrm{V}_{\mathrm{SS}}=0 \mathrm{~V}$ | $\mathrm{V}_{\text {SS }}$ |  | $\mathrm{V}_{\mathrm{CC}}$ | V |
|  | Noise | Ref: 1V |  | -120 |  | $\mathrm{dBV} / \sqrt{\mathrm{Hz}}$ |
|  | Resolution |  |  | 0.4 |  | \% |
|  | Absolute Linearity (Note 10) | $\mathrm{R}_{\mathrm{W}(\mathrm{n})(\text { actual })}-\mathrm{R}_{\mathrm{W}(\mathrm{n})(\text { expected) }}$ (Note 14) |  |  | $\pm 1$ | MI (Note 12) |
|  | Relative Linearity (Note 11) | $\mathrm{R}_{\mathrm{w}(\mathrm{n}+1)}-\left[\mathrm{R}_{\mathrm{w}(\mathrm{n})}+\mathrm{MI}\right]$ (Note 14) |  |  | $\pm 0.2$ | MI (Note 12) |
|  | Temperature Coefficient of RTOTAL |  |  | $\pm 300$ |  | $\mathrm{ppm} /{ }^{\circ} \mathrm{C}$ |
|  | Ratiometric Temp. Coefficient |  |  | $\pm 20$ |  | $\mathrm{ppm} /{ }^{\circ} \mathrm{C}$ |
| $\mathrm{C}_{\mathrm{H}} / \mathrm{C}_{\mathrm{L}} / \mathrm{C}_{\mathrm{W}}$ | Potentiometer Capacitances | See Macro model |  | 10/10/25 |  | pF |

NOTES:
10. Absolute linearity is utilized to determine actual wiper voltage versus expected voltage as determined by wiper position when used as a potentiometer.
11. Relative linearity is utilized to determine the actual change in voltage between two successive tap positions when used as a potentiometer. It is a measure of the error in step size.
12. $\mathrm{MI}=\mathrm{RTOT} / 255$ or $\left(\mathrm{R}_{\mathrm{H}}-\mathrm{R}_{\mathrm{L}}\right) / 255$, single pot
13. During power-up $\mathrm{V}_{\mathrm{CC}}>\mathrm{V}_{\mathrm{H}}, \mathrm{V}_{\mathrm{L}}$, and $\mathrm{V}_{\mathrm{W}}$.
14. $n=0,1,2, \ldots, 255 ; m=0,1,2, \ldots ., 254$.

DC Electrical Specifications Over the recommended Operating Conditions unless otherwise specified.

## Endurance and Data Retention

| PARAMETER | MIN | UNITS |
| :--- | :---: | :---: |
| Minimum Endurance | 100,000 | Data changes per bit per register |
| Data Retention | 100 | years |

## Capacitance

| SYMBOL | TEST | TYP | UNITS | TEST CONDITIONS |
| :--- | :--- | :---: | :---: | :---: |
| $\mathrm{C}_{\mathrm{IN} / \mathrm{OUT}}$ | Input /Output capacitance (SDA) | 8 | pF | $\mathrm{V}_{\mathrm{OUT}}=0 \mathrm{~V}$ |
| $\mathrm{C}_{\mathrm{IN}}$ | Input capacitance (SCL, $\overline{\mathrm{WP}}, \mathrm{A} 2, \mathrm{~A} 1$ and AO$)$ | 6 | pF | $\mathrm{V}_{\mathrm{IN}}=0 \mathrm{~V}$ |

## Power-Up Timing

| SYMBOL | PARAMETER | MIN | MAX | UNITS |
| :--- | :--- | :---: | :---: | :---: |
| $t_{r} \vee_{\text {CC }}$ (Note 15) | $V_{\text {CC }}$ Power-up rate | 0.2 | 50 | $\mathrm{~V} / \mathrm{ms}$ |
| $t_{\text {PUR }}$ (Note 16) | Power-up to initiation of read operation |  | 1 |  |
| $t_{\text {PUW }}$ (Note 16) | Power-up to initiation of write operation |  | 50 | ms |

NOTES:
15. This parameter is not $100 \%$ tested.
16. $\mathrm{t}_{\text {PUR }}$ and $\mathrm{t}_{\text {PUW }}$ are the delays required from the time the (last) power supply ( $\mathrm{V}_{\mathrm{CC}}$ ) is stable until the specific instruction can be issued. These parameters are periodically sampled and not $100 \%$ tested.

## AC Test Conditions

| Input Pulse Levels | $\mathrm{V}_{\mathrm{CC}} \times 0.1$ to $\mathrm{V}_{\mathrm{CC}} \times 0.9$ |
| :--- | :---: |
| Input rise and fall times | 10 ns |
| Input and output timing level | $\mathrm{V}_{\mathrm{CC}} \times 0.5$ |

## Equivalent AC Load Circuit

AC Timing

Amplitude $\propto R_{A}, R_{B}$
FUNCTION GENERATOR

Thin Shrink Small Outline Plastic Packages (TSSOP)

NOTES:

1. These package dimensions are within allowable dimensions of JEDEC MO-153-AC, Issue E.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension " $D$ " does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15 mm (0.006 inch) per side.
4. Dimension "E1" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.15 mm ( 0.006 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. " L " is the length of terminal for soldering to a substrate.
7. " N " is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall be 0.08 mm ( 0.003 inch) total in excess of "b" dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07 mm ( 0.0027 inch).
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact. (Angles in degrees)
