1. INTRODUCTION

The RCM3209 and RCM3229 RabbitCore[®] modules are designed to be the heart of embedded control systems. The RCM3209 features an integrated 10/100Base-T Ethernet port and provides for LAN and Internet-enabled systems to be built as easily as serial-communication systems.

In addition to the features already mentioned above, the RCM3209 and RCM3229 have two clocks (main oscillator and real-time clock), reset circuitry, and the circuitry necessary for management of battery backup of the Rabbit 3000's internal real-time clock and the static RAM. Two 34-pin headers bring out the Rabbit 3000 I/O bus lines, parallel ports, and serial ports.

The RCM3209 or RCM3229 receives +3.3 V power from the customer-supplied motherboard on which it is mounted. The RCM3209 and RCM3229 can interface with all kinds of CMOS-compatible digital devices through the motherboard.

The Development Kit has what you need to design your own microprocessor-based system: a complete Dynamic C software development system and a Prototyping Board that allows you to evaluate the RCM3209 or RCM3229, and to prototype circuits that interface to the RCM3209 or RCM3229 module.

1.1 RCM3209/RCM3229 Features

- Small size: 1.85" x 2.73" x 0.86"
(47 mm x 69 mm x 22 mm)
- Microprocessor: Rabbit 3000 running at 44.2 MHz
- (RCM3209 only) 10/100Base-T auto MDI/MDIX Ethernet port chooses Ethernet interface automatically based on whether a crossover cable or a straight-through cable is used in a particular setup
- 52 parallel 5 V tolerant I/O lines: 44 configurable for I/O, 4 fixed inputs, 4 fixed outputs
- Two additional digital inputs, two additional digital outputs
- External reset input
- Alternate I/O bus can be configured for 8 data lines and 6 address lines (shared with parallel I/O lines), I/O read/write
- Ten 8-bit timers (six cascadable) and one 10-bit timer with two match registers
- 512K flash memory, 512K program execution SRAM, 256K data SRAM
- Real-time clock
- Watchdog supervisor
- Provision for customer-supplied backup battery via connections on header J2
- 10-bit free-running PWM counter and four width registers
- Two-channel Input Capture can be used to time input signals from various port pins
- Two-channel Quadrature Decoder accepts inputs from external incremental encoder modules
- Six CMOS-compatible serial ports: maximum asynchronous baud rate of 5.5 Mbps. Four ports are configurable as a clocked serial port (SPI), and two ports are configurable as SDLC/HDLC serial ports.
- Supports 1.15 Mbps IrDA transceiver.

The RCM3209 and RCM3229 modules are similar in form, dimensions, and function to the RCM3200/RCM3220, and based on the RCM3900 RabbitCore modules which were first released in 2008. The RCM3900/RCM3910 and RCM3309/RCM3319 RabbitCore modules are similar to the RCM3209/RCM3229, but they offer fixed NAND and/or removable media mass-storage memories. The RCM3309 and the RCM3319 offer fixed serial flash mass-storage options instead.

Table 1 summarizes the main features of the RCM3209 and the RCM3229 modules.

Table 1. RCM3209/RCM3229 Features

Feature	RCM3209	RCM3229
Microprocessor	Rabbit 3000 running at 44.2 MHz	
SRAM	512K program (fast SRAM) + 256K data	
Flash Memory (program)	512K	
RJ-45 Ethernet Connector, Filter Capacitors, and LEDs	Yes	No
Serial Ports	6 shared high-speed, CMOS-compatible ports: 6 are configurable as asynchronous serial ports; 4 are configurable as clocked serial ports (SPI); 2 are configurable as SDLC/HDLC serial ports; 1 asynchronous serial port is dedicated for programming	

The RCM3209 and RCM3229 are programmed over a standard PC USB serial port through a programming cable supplied with the Development Kit, and can also be programmed directly over an Ethernet link using the RabbitLink.

Appendix A provides detailed specifications for the RCM3209/RCM3229.

1.2 Comparing the RCM3209/RCM3229 and RCM3200/RCM3220

This section compares the two lines of RabbitCore modules.

- **Temperature Specifications** — We can no longer obtain certain components for the RCM3200/RCM3220 RabbitCore modules that support the -40°C to +70°C temperature range. RCM3200/RCM3220 RabbitCore modules manufactured after May, 2008, are specified to operate at 0°C to +70°C. The RCM3209/RCM3229, rated for -40°C to +85°C, are offered to customers requiring a larger temperature range after May, 2008.
- **Maximum Current** — The RCM3200/RCM3220 draws 255 mA vs. the 325 mA required by the RCM3209 (with Ethernet) or 190 mA (RCM3229 without Ethernet).
- **LEDs** — The **LNK/ACT** LEDs have been combined to one LED on the RCM3209, and the RCM3209 has an **FDX/COL** LED where the **ACT** LED was on the RCM3200. The RCM3229, like the RCM3220, has no LEDs and no Ethernet.
- **Ethernet chip.** A different Ethernet controller chip is used on the RCM3209. The Ethernet chip is able to detect automatically whether a crossover cable or a straight-through cable is being used in a particular setup, and will configure the signals on the Ethernet jack interface. The RCM3229, like the RCM3220, has no Ethernet interface.
- **Dynamic C** — You may run an application developed for the RCM3200/RCM3220 on the RCM3209/RCM3229 after you recompile it using Dynamic C v. 9.60. The new Dynamic C release incorporates many of the modules that previously had to be purchased separately.

1.3 Advantages of the RCM3209/RCM3229

- Fast time to market using a fully engineered, “ready to run” microprocessor core.
- Competitive pricing when compared with the alternative of purchasing and assembling individual components.
- Easy C-language program development and debugging
- Program Download Utility and cloning board options for rapid production loading of programs.
- Generous memory size allows large programs with tens of thousands of lines of code, and substantial data storage.
- Integrated Ethernet port for network connectivity, royalty-free TCP/IP software.
- Pin-compatible with RCM3309/RCM3319 and RCM3900/RCM3910 to offer fixed and/or removable media mass-storage memory options.

1.4 Development and Evaluation Tools

1.4.1 RCM3200 Development Kit

The RCM3200 Development Kit contains the hardware you need to use your RCM3209 or RCM3229 module.

- RCM3209 module.
- Prototyping Board.
- Universal AC adapter, 12 V DC, 1 A (includes Canada/Japan/U.S., Australia/N.Z., U.K., and European style plugs).
- USB programming cable with 10-pin header.
- *Dynamic C* CD-ROM, with complete product documentation on disk.
- *Getting Started* instructions.
- Accessory parts for use on the Prototyping Board.
- Screwdriver and Cat. 5 Ethernet cables.
- *Rabbit 3000 Processor Easy Reference* poster.
- Registration card.

Figure 1. RCM3200 Development Kit

1.4.2 Software

The RCM3209 and the RCM3229 are programmed using version 9.60 of Rabbit's Dynamic C. A compatible version is included on the Development Kit CD-ROM. This version of Dynamic C includes the popular μ C/OS-II real-time operating system, point-to-point protocol (PPP), FAT file system, RabbitWeb, and other select libraries.

Rabbit also offers for purchase the Rabbit Embedded Security Pack featuring the Secure Sockets Layer (SSL) and a specific Advanced Encryption Standard (AES) library. In addition to the Web-based technical support included at no extra charge, a one-year telephone-based technical support subscription is also available for purchase. Visit our Web site at www.rabbit.com for further information and complete documentation, or contact your Rabbit sales representative or authorized distributor.

1.4.3 Connectivity Interface Kits

Rabbit has available a Connector Adapter Board to allow you to use the the RCM3209/RCM3229 with header sockets that have a 0.1" pitch.

- Connector Adapter Board (Part No. 151-0114)—allows you to plug the RCM3209/RCM3229 whose headers have a 2 mm pitch into header sockets with a 0.1" pitch.

Visit our Web site at www.rabbit.com or contact your Rabbit sales representative or authorized distributor for further information.

1.4.4 Online Documentation

The online documentation is installed along with Dynamic C, and an icon for the documentation menu is placed on the workstation's desktop. Double-click this icon to reach the menu. If the icon is missing, use your browser to find and load **default.htm** in the **docs** folder, found in the Dynamic C installation folder.

The latest versions of all documents are always available for free, unregistered download from our Web sites as well.

2. HARDWARE SETUP

This chapter describes how to set up and connect the RCM3209 and the Prototyping Board included in the RCM3200 Development Kit.

NOTE: This chapter (and this manual) assume that you have a Development Kit. If you purchased an RCM3200 series RabbitCore module by itself, you will have to adapt the information in this chapter and elsewhere to your test and development setup.

2.1 Install Dynamic C

To develop and debug programs for an RCM3200 series RabbitCore module (and for all other Rabbit hardware), you must install and use Dynamic C.

If you have not yet installed Dynamic C, do so now by inserting the Dynamic C CD from the Development Kit in your PC's CD-ROM drive. If autorun is enabled, the CD installation will begin automatically.

If autorun is disabled or the installation otherwise does not start, use the Windows **Start | Run** menu or Windows Disk Explorer to launch `setup.exe` from the root folder of the CD-ROM.

The installation program will guide you through the installation process. Most steps of the process are self-explanatory.

Dynamic C uses a COM (serial) port to communicate with the target development system. The installation allows you to choose the COM port that will be used. The default selection is COM1. Select any available USB port for Dynamic C's use. This selection can be changed later within Dynamic C.

NOTE: The installation utility does not check the selected COM port in any way. Specifying a port in use by another device (mouse, modem, etc.) may lead to a message such as "could not open serial port" when Dynamic C is started.

Once your installation is complete, you will have up to three icons on your PC desktop. One icon is for Dynamic C, one opens the documentation menu, and the third is for the Rabbit Field Utility, a tool used to download precompiled software to a target system.

If you have purchased the optional Dynamic C Rabbit Embedded Security Pack, install it after installing Dynamic C. You must install the Rabbit Embedded Security Pack in the same directory where Dynamic C was installed.

2.2 Hardware Connections

There are three steps to connecting the Prototyping Board for use with Dynamic C and the sample programs:

1. Attach the RCM3200 series RabbitCore module to the Prototyping Board.
2. Connect the programming cable between the RCM3200 series RabbitCore module and the workstation PC.
3. Connect the power supply to the Prototyping Board.

2.2.1 Step 1 — Attach Module to Prototyping Board

Turn the RCM3209 module so that the Ethernet connector end of the module extends off the Prototyping Board, as shown in Figure 2 below. Align the pins from headers J61 and J62 on the bottom side of the module into header sockets RCM2JA and RCM2JB on the Prototyping Board. The installation of the RCM3229, which does not have an Ethernet connector, is similar.

Figure 2. Install the RCM3209 Module on the Prototyping Board

Although you can install a single module into either the **MASTER** or the **SLAVE** position on the Prototyping Board, all the Prototyping Board features (switches, LEDs, serial port drivers, etc.) are connected to the **MASTER** position — install a single module in the **MASTER** position.

NOTE: It is important that you line up the pins on headers J61 and J62 of the RCM3209/RCM3229 exactly with the corresponding pins of header sockets RCM2JA and RCM2JB on the Prototyping Board. The header pins may become bent or damaged if the pin alignment is offset, and the module will not work. Permanent electrical damage to the module may also result if a misaligned module is powered up.

Press the module's pins firmly into the Prototyping Board header sockets—press down in the area above the header pins using your thumbs or fingers over the connectors as shown in Figure 2. Do **not** press down on the middle of the RCM3209/RCM3229 module to avoid flexing the module, which could damage the module or the components on the module.

Should you need to remove the RCM3209/RCM3229 module, grasp it with your fingers along the sides by the connectors and gently work the module up to pull the pins away from the sockets where they are installed. Do **not** remove the module by grasping it at the top and bottom.

2.2.2 Step 2 — Connect Programming Cable

The programming cable connects the RCM3209/RCM3229 to the PC running Dynamic C to download programs and to monitor the RCM3209/RCM3229 module during debugging.

Connect the 10-pin connector of the programming cable labeled **PROG** to header J1 on the RCM3209/RCM3229 module as shown in Figure 3. Be sure to orient the marked (usually red) edge of the cable towards pin 1 of the connector. (Do not use the **DIAG** connector, which is used for a normal serial connection.)

Figure 3. Connect Programming Cable to RCM3209/RCM3229

Connect the other end of the programming cable to an available USB port on your PC or workstation. Your PC should recognize the new USB hardware, and the LEDs in the shrink-wrapped area of the USB programming cable will flash.

2.2.3 Step 3 — Connect Power

When all other connections have been made, you can connect power to the Prototyping Board.

First, prepare the AC adapter for the country where it will be used by selecting the plug. The RCM3209/RCM3229 Development Kit presently includes Canada/Japan/U.S., Australia/N.Z., U.K., and European style plugs. Snap in the top of the plug assembly into the slot at the top of the AC adapter as shown in Figure 4, then press down on the spring-loaded clip below the plug assembly to allow the plug assembly to click into place.

Connect the AC adapter to the power connector header J9 on the Prototyping Board as shown in Figure 4 below.

Figure 4. Power Supply Connections

Plug in the AC adapter. The red power lamp on the Prototyping Board to the left of header J9 should light up. The RCM3209/RCM3229 and the Prototyping Board are now ready to be used.

NOTE: A **RESET** button is provided on the Prototyping Board to allow hardware reset without disconnecting power.

2.3 Starting Dynamic C

Once the RCM3209/RCM3229 is connected as described in the preceding pages, start Dynamic C by double-clicking on the Dynamic C icon on your desktop or in your **Start** menu. Select **Code and BIOS in Flash, Run in RAM** on the “Compiler” tab in the Dynamic C **Options > Project Options** menu. Then click on the “Communications” tab and verify that **Use USB to Serial Converter** is selected to support the USB programming cable. Click **OK**.

2.4 Run a Sample Program

Use the **File** menu to open the sample program **PONG.C**, which is in the Dynamic C **SAMPLES** folder. Press function key **F9** to compile and run the program. The **STUDIO** window will open on your PC and will display a small square bouncing around in a box.

This program shows that the CPU is working. The sample program described in Section 6.5, “Run the PINGME.C Sample Program,” tests the TCP/IP portion of the board.

2.4.1 Troubleshooting

If Dynamic C cannot find the target system (error message "**No Rabbit Processor Detected.**"):

- Check that the RCM3209/RCM3229 is powered correctly — the power LED on the Prototyping Board should be lit when the RCM3209/RCM3229 is mounted on the Prototyping Board and the AC adapter is plugged in.
- Check both ends of the programming cable to ensure that they are firmly plugged into the PC and the **PROG** connector, not the **DIAG** connector, is plugged in to the programming port on the RCM3209/RCM3229 with the marked (colored) edge of the programming cable towards pin 1 of the programming header.
- Ensure that the RCM3209/RCM3229 module is firmly and correctly installed in its connectors on the Prototyping Board.
- Dynamic C uses the USB port specified during installation. Select a different COM port within Dynamic C. From the **Options** menu, select **Project Options**, then select **Communications**. Select another USB COM port from the list, then click **OK**. Press **<Ctrl-Y>** to force Dynamic C to recompile the BIOS. If Dynamic C still reports it is unable to locate the target system, repeat the above steps until you locate the USB COM port used by the RCM3209/RCM3229 programming cable.
- If you get an error message when you plugged the programming cable into a USB port, you will have to install USB drivers. Drivers for Windows XP are available in the Dynamic C **Drivers\Rabbit USB Programming Cable\WinXP_2K** folder — double-click **DPInst.exe** to install the USB drivers. Drivers for other operating systems are available online at www.ftdichip.com/Drivers/VCP.htm.

If Dynamic C appears to compile the BIOS successfully, but you then receive a communication error message when you compile and load a sample program, it is possible that your PC cannot handle the higher program-loading baud rate. Try changing the maximum download rate to a slower baud rate as follows.

- Locate the **Serial Options** dialog on the “Communications” tab in the Dynamic C **Options > Project Options** menu. Select a slower Max download baud rate. Click **OK** to save.

If a program compiles and loads, but then loses target communication before you can begin debugging, it is possible that your PC cannot handle the default debugging baud rate. Try lowering the debugging baud rate as follows.

- Locate the **Serial Options** dialog in the Dynamic C **Options > Project Options > Communications** menu. Choose a lower debug baud rate. Click **OK** to save.

Press **<Ctrl-Y>** to force Dynamic C to recompile the BIOS. The LEDs on the USB programming cable will blink and you should receive a **Bios compiled successfully** message.

2.5 Where Do I Go From Here?

If the sample program ran fine, you are now ready to go on to other sample programs and to develop your own applications. The source code for the sample programs is provided to allow you to modify them for your own use. The *RCM3209/RCM3229 User's Manual* also provides complete hardware reference information and describes the software function calls for the RCM3209 and the RCM3229, the Prototyping Board, and the optional LCD/keypad module.

For advanced development topics, refer to the *Dynamic C User's Manual* and the *Dynamic C TCP/IP User's Manual*, also in the online documentation set.

2.5.1 Technical Support

NOTE: If you purchased your RCM3209/RCM3229 through a distributor or through a Rabbit partner, contact the distributor or partner first for technical support.

If there are any problems at this point:

- Use the Dynamic C **Help** menu to get further assistance with Dynamic C.
- Check the Rabbit Technical Bulletin Board and forums at www.rabbit.com/support/bb/ and at www.rabbit.com/forums/.
- Use the Technical Support e-mail form at www.rabbit.com/support/.

3. RUNNING SAMPLE PROGRAMS

To develop and debug programs for the RCM3209/RCM3229 (and for all other Rabbit hardware), you must install and use Dynamic C.

3.1 Introduction

To help familiarize you with the RCM3209/RCM3229 modules, Dynamic C includes several sample programs. Loading, executing and studying these programs will give you a solid hands-on overview of the RCM3209/RCM3229's capabilities, as well as a quick start using Dynamic C as an application development tool.

NOTE: The sample programs assume that you have at least an elementary grasp of the C programming language. If you do not, see the introductory pages of the *Dynamic C User's Manual* for a suggested reading list.

Complete information on Dynamic C is provided in the *Dynamic C User's Manual*.

In order to run the sample programs discussed in this chapter and elsewhere in this manual,

1. Your RCM3209/RCM3229 module must be plugged in to the Prototyping Board as described in Chapter 2, "Hardware Setup."
2. Dynamic C must be installed and running on your PC.
3. The RCM3209/RCM3229 module must be connected to your PC through the serial programming cable.
4. Power must be applied to the RCM3209/RCM3229 through the Prototyping Board.

Refer to Chapter 2, "Hardware Setup," if you need further information on these steps.

Remember to allow the compiler to run the application in the program execution SRAM by selecting **Code and BIOS in Flash, Run in RAM** from the Dynamic C **Options > Project Options > Compiler** menu.

To run a sample program, open it with the **File** menu, then press function key **F9** to compile and run the program.

Complete information on Dynamic C is provided in the *Dynamic C User's Manual*.

3.2 Sample Programs

Of the many sample programs included with Dynamic C, several are specific to the RCM3209/RCM3229. Sample programs illustrating the general operation of the RCM3209/RCM3229, and serial communication are provided in the `SAMPLES\RCM3200` folder. Each sample program has comments that describe the purpose and function of the program. Follow the instructions at the beginning of the sample program.

- **CONTROLLED.C**—uses the **STDIO** window to demonstrate digital outputs by toggling LEDs DS1 and DS2 on the Prototyping Board on and off.

Parallel Port G bit 6 = LED DS1

Parallel Port G bit 7 = LED DS2

Once you have compiled and run this program, you will be prompted via the Dynamic C **STDIO** window to select LED DS1 or DS2. Use your PC keyboard to make your selection.

Once you have selected the LED, you will be prompted to select to turn the LED either ON or OFF. A logic low will light up the LED you selected.

- **FLASHLED1.C**—demonstrates the use of costatements to flash LEDs DS1 and DS2 on the Prototyping Board at different rates. Once you have compiled and run this program, LEDs DS1 and DS2 will flash on/off at different rates.
- **FLASHLED2.C**—demonstrates the use of cofunctions and costatements to flash LEDs DS1 and DS2 on the Prototyping Board at different rates. Once you have compiled and run this program, LEDs DS1 and DS2 will flash on/off at different rates.
- **TOGGLESWITCH.C**—demonstrates the use of costatements (cooperative multitasking) to detect switches using the press-and-release method of debouncing. LEDs DS1 and DS2 on the Prototyping Board are turned on and off when you press switches S2 and S3.
- **IR_DEMO.C**—Demonstrates sending Modbus ASCII packets between two Prototyping Board assemblies via the IrDA transceivers with the IrDA transceivers facing each other. Note that this sample program will only work with the RCM30/31/32XX Prototyping Board.

First, compile and run this program on one Prototyping Board assembly, then remove the programming cable and press the **RESET** button on the Prototyping Board so that the first RabbitCore module is operating in the **Run** mode. Then connect the programming cable to the second Prototyping Board assembly with the RCM3209/RCM3229 and compile and run the same sample program. With the programming cable still connected to the second Prototyping Board assembly, press switch S2 on the second Prototyping Board to transmit a packet. Once the first Prototyping Board assembly receives a test packet, it will send back a response packet that will be displayed in the Dynamic C **STDIO** window. The test packets and response packets have different codes.

Once you have loaded and executed these five programs and have an understanding of how Dynamic C and the RCM3209/RCM3229 modules interact, you can move on and try the other sample programs, or begin building your own.

3.2.1 Serial Communication

The following sample programs can be found in the `SAMPLES\RCM3200\SERIAL` folder.

- **FLOWCONTROL.C**—This program demonstrates hardware flow control by configuring Serial Port C (PC3/PC2) for CTS/RTS with serial data coming from TxB at 115,200 bps. One character at a time is received and is displayed in the **STDIO** window.

To set up the Prototyping Board, you will need to tie TxB and RxB together on the RS-232 header at J5, and you will also tie TxC and RxC together using the jumpers supplied in the Development Kit as shown in the diagram.

A repeating triangular pattern should print out in the **STDIO** window.

The program will periodically switch flow control on or off to demonstrate the effect of no flow control.

- **PARITY.C**—This program demonstrates the use of parity modes by repeatedly sending byte values 0–127 from Serial Port B to Serial Port C. The program will switch between generating parity or not on Serial Port B. Serial Port C will always be checking parity, so parity errors should occur during every other sequence.

To set up the Prototyping Board, you will need to tie TxB and RxC together on the RS-232 header at J5 using the jumpers supplied in the Development Kit as shown in the diagram.

The Dynamic C **STDIO** window will display the error sequence.

- **SIMPLE3WIRE.C**—This program demonstrates basic RS-232 serial communication. Lower case characters are sent by TxC, and are received by RxB. The characters are converted to upper case and are sent out by TxB, are received by RxC, and are displayed in the Dynamic C **STDIO** window.

To set up the Prototyping Board, you will need to tie TxB and RxC together on the RS-232 header at J5, and you will also tie RxB and TxC together using the jumpers supplied in the Development Kit as shown in the diagram.

- **SIMPLE5WIRE.C**—This program demonstrates 5-wire RS-232 serial communication with flow control on Serial Port C and data flow on Serial Port B.

To set up the Prototyping Board, you will need to tie TxB and RxB together on the RS-232 header at J5, and you will also tie TxC and RxC together using the jumpers supplied in the Development Kit as shown in the diagram.

Once you have compiled and run this program, you can test flow control by disconnecting TxC from RxC while the program is running. Characters will no longer appear in the **STDIO** window, and will display again once TxC is connected back to RxC.

- **SWITCHCHAR.C**—This program demonstrates transmitting and then receiving an ASCII string on Serial Ports B and C. It also displays the serial data received from both ports in the **STDIO** window.

To set up the Prototyping Board, you will need to tie TxB and RxC together on the RS-232 header at J5, and you will also tie RxB and TxC together using the jumpers supplied in the Development Kit as shown in the diagram.

Once you have compiled and run this program, press and release S2 and S3 on the Prototyping Board. The data sent between the serial ports will be displayed in the **STDIO** window.

Two sample programs, **SIMPLE485MASTER.C** and **SIMPLE485SLAVE.C**, are available to illustrate RS-485 master/slave communication. To run these sample programs, you will need a second Rabbit-based system with RS-485, and you will also have to add an RS-485 transceiver such as the SP483E and bias resistors to the RCM30/31/32XX Prototyping Board.

The diagram shows the connections. You will have to connect PC0 and PC1 (Serial Port D) on the RCM30/31/32XX Prototyping Board to the RS-485 transceiver, and you will connect PD4 to the RS-485 transceiver to enable or disable the RS-485 transmitter.

The RS-485 connections between the slave and master devices are as follows.

- RS485+ to RS485+
- RS485- to RS485-
- GND to GND
- **SIMPLE485MASTER.C**—This program demonstrates a simple RS-485 transmission of lower case letters to a slave RCM3209/RCM3229. The slave will send back converted upper case letters back to the master RCM3209/RCM3229 and display them in the **STDIO** window. Use **SIMPLE485SLAVE.C** to program the slave RCM3209/RCM3229.
- **SIMPLE485SLAVE.C**—This program demonstrates a simple RS-485 transmission of lower case letters to a master RCM3209/RCM3229. The slave will send back converted upper case letters back to the master RCM3209/RCM3229 and display them in the **STDIO** window. Use **SIMPLE485MASTER.C** to program the master RCM3209/RCM3229.

3.2.2 Other Sample Programs

Section 6.5 describes the TCP/IP sample programs, and Appendix C.7 provides sample programs for the optional LCD/keypad module that can be installed on the Prototyping Board.

4. HARDWARE REFERENCE

Chapter 4 describes the hardware components and principal hardware subsystems of the RCM3209/RCM3229. Appendix A, “RCM3209/RCM3229 Specifications,” provides complete physical and electrical specifications.

Figure 5 shows these Rabbit-based subsystems designed into the RCM3209/RCM3229.

Figure 5. RCM3209/RCM3229 Subsystems

4.1 RCM3209/RCM3229 Digital Inputs and Outputs

The RCM3209/RCM3229 has 52 parallel I/O lines grouped in seven 8-bit ports available on headers J1 and J2. The 44 bidirectional I/O lines are located on pins PA0–PA7, PB0, PB2–PB7, PD2–PD7, PE0–PE1, PE3–PE7, PF0–PF7, and PG0–PG7.

Figure 6 shows the RCM3209/RCM3229 pinouts for headers J61 and J62.

Figure 6. RCM3209/RCM3229 Pinouts

The pinouts for the RCM3000, RCM3100, RCM3209, RCM3309, and RCM3900 are compatible. Visit the [Web site](#) for further information.

Headers J61 and J62 are standard 2 × 34 headers with a nominal 2 mm pitch. An RJ-45 Ethernet jack is also included on the RCM3209.

Pins 29–32 on header J61 are configured using 0 Ω resistors at locations JP9, JP10, JP7, and JP8 to enable connections to PD2, PD3, PD6, and PD7 respectively. They may also be reconfigured to carry the Ethernet signals TPO+, TPO–, TPI+, and TPI–, but this capability is reserved for future use.

Pins 33 and 34 on header J61 are wired via 0 Ω surface-mount resistors at JP2 and JP3 to carry the **ACT** and **LINK** signals that illuminate the corresponding LEDs on the RCM3209 module. These pins may be “configured” to carry PD0 and PD1, an option that is reserved for future use.

See Appendix A.5 for more information about the locations of these headers.

Figure 7 shows the use of the Rabbit 3000 microprocessor ports in the RCM3209/RCM3229 modules.

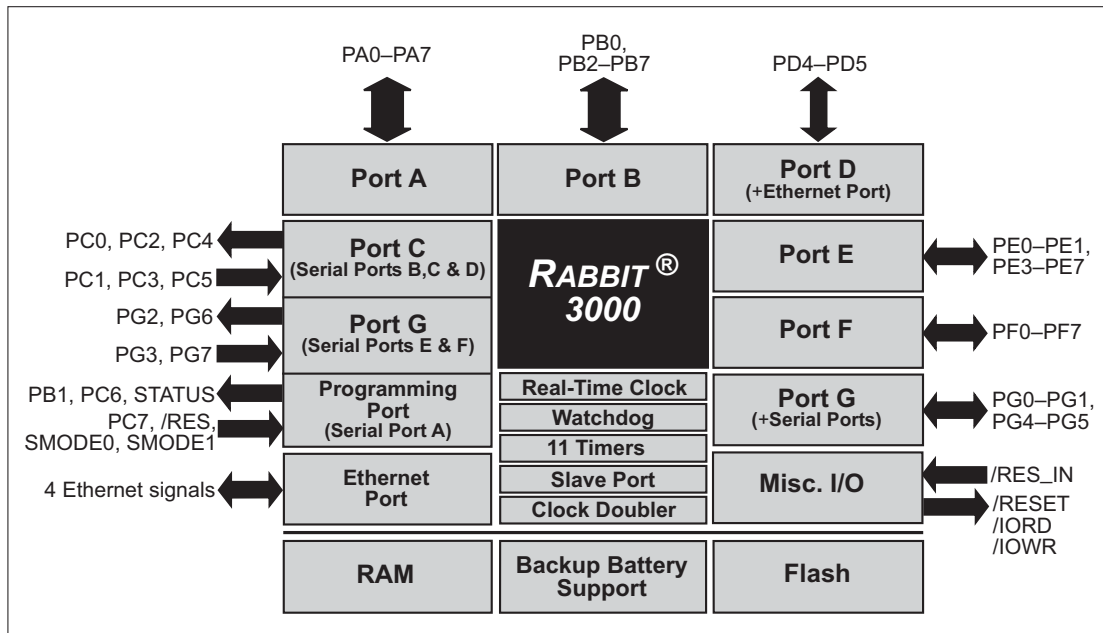

Figure 7. Use of Rabbit 3000 Ports

The ports on the Rabbit 3000 microprocessor used in the RCM3209/RCM3229 are configurable, and so the factory defaults can be reconfigured. Table 2 lists the Rabbit 3000 factory defaults and the alternate configurations.

Table 2. RCM3209/RCM3229 Pinout Configurations

Pin	Pin Name	Default Use	Alternate Use	Notes
1	GND			
2	STATUS	Output (Status)	Output	
3–10	PA[7:0]	Parallel I/O	External data bus (ID0–ID7) Slave port data bus (SD0–SD7)	
11	PF3	Input/Output	QD2A	
12	PF2	Input/Output	QD2B	
13	PF1	Input/Output	QD1A CLKC	
14	PF0	Input/Output	QD1B CLKD	
15	PC0	Output	TXD	Serial Port D
16	PC1	Input	RXD	
17	PC2	Output	TXC	Serial Port C
18	PC3	Input	RXC	
19	PC4	Output	TXB	Serial Port B
20	PC5	Input	RXB	
21	PC6	Output	TXA	Serial Port A (programming port)
22	PC7	Input	RXA	
23	PG0	Input/Output	TCLKF	Serial Clock F output
24	PG1	Input/Output	RCLKF	Serial Clock F input
25	PG2	Input/Output	TXF	Serial Port F
26	PG3	Input/Output	RXF	
27	PD4	Input/Output	ATXB	
28	PD5	Input/Output	ARXB	
29	PD2	Input/Output	TPOUT– *	Ethernet transmit port
30	PD3	Input/Output	TPOUT+ *	
31	PD6	Input/Output	TPIN– *	Ethernet receive port
32	PD7	Input/Output	TPIN+ *	
33	LNK_OUT	Output		Max. current draw 1 mA (see Note 1)
34	ACT_OUT	Output		

* Pins 29–32 are reserved for future use.

Table 2. RCM3209/RCM3229 Pinout Configurations (continued)

Pin	Pin Name	Default Use	Alternate Use	Notes	
Header J62	1	/RES	Reset output	Reset input	Reset output from Reset Generator
	2	PB0	Input/Output	CLKB	
	3	PB2	Input/Output	IA0 /SWR	External Address 0 Slave port write
	4	PB3	Input/Output	IA1 /SRD	External Address 1 Slave port read
	5	PB4	Input/Output	IA2 SA0	External Address 2 Slave port Address 0
	6	PB5	Input/Output	IA3 SA1	External Address 3 Slave port Address 1
	7	PB6	Input/Output	IA4	External Address 4
	8	PB7	Input/Output	IA5 /SLAVEATTN	External Address 5 Slave Attention
	9	PF4	Input/Output	AQD1B PWM0	
	10	PF5	Input/Output	AQD1A PWM1	
	11	PF6	Input/Output	AQD2B PWM2	
	12	PF7	Input/Output	AQD2A PWM3	
	13	PE7	Input/Output	I7 /SCS	
	14	PE6	Input/Output	I6	
	15	PE5	Input/Output	I5 INT1B	
	16	PE4	Input/Output	I4 INT0B	
	17	PE3	Input/Output	I3	
	18	PE1	Input/Output	I1 INT1A	I/O Strobe 1 Interrupt 1A
	19	PE0	Input/Output	I0 INT0A	I/O Strobe 0 Interrupt 0A

Table 2. RCM3209/RCM3229 Pinout Configurations (continued)

Pin	Pin Name	Default Use	Alternate Use	Notes	
Header J62	20	PG7	Input/Output	RXE	Serial Port E
	21	PG6	Input/Output	TXE	
	22	PG5	Input/Output	RCLKE	Serial Clock E input
	23	PG4	Input/Output	TCLKE	Serial Clock E output
	24	/IOWR	Output		External write strobe
	25	/IORD	Input		External read strobe
	26–27	SMODE0, SMODE1	(0,0)—start executing at address zero (0,1)—cold boot from slave port (1,0)—cold boot from clocked Serial Port A SMODE0 =1, SMODE1 = 1 Cold boot from asynchronous Serial Port A at 2400 bps (programming cable connected)		Also connected to programming cable
	28	/RESET_IN	Input		Input to Reset Generator
	29	VRAM	Output		See Notes below table
	30	VBAT_EXT	3 V battery Input		Minimum battery voltage 2.85 V
	31	+3.3V	Input		3.15–3.45 V DC
	32	GND			
	33	n.c.			Reserved for future use
	34	GND			

Notes

1. When using pins 33–34 on header J61 to drive LEDs, you must use an external buffer to drive these external LEDs. These pins are not connected on the RCM3229, which does not have the LEDs installed.
2. The VRAM voltage is temperature-dependent. If the VRAM voltage drops below about 1.2 V to 1.5 V, the contents of the battery-backed SRAM may be lost. If VRAM drops below 1.0 V, the 32 kHz oscillator could stop running. Pay careful attention to this voltage if you draw any current from this pin.

4.1.1 Memory I/O Interface

The Rabbit 3000 address lines (A0–A19) and all the data lines (D0–D7) are routed internally to the onboard flash memory and SRAM chips. I/O write (/IOWR) and I/O read (/IORD) are available for interfacing to external devices.

Parallel Port A can also be used as an external I/O data bus to isolate external I/O from the main data bus. Parallel Port B pins PB2–PB7 can also be used as an auxiliary address bus.

When using the external I/O bus, you must add the following line at the beginning of your program.

```
#define PORTA_AUX_IO // required to enable external I/O bus
```

4.1.2 LEDs

The RCM3209 has three Ethernet status LEDs located beside the RJ-45 Ethernet jack—these are discussed in Section 4.2.

4.1.3 Other Inputs and Outputs

The status, /RESET_IN, SMODE0 and SMODE1 I/O are normally associated with the programming port. Since the status pin is not used by the system once a program has been downloaded and is running, the status pin can then be used as a general-purpose CMOS output. The programming port is described in more detail in Section 4.2.3.

/RES is an output from the reset circuitry that can be used to reset external peripheral devices.

4.1.4 5 V Tolerant Inputs

The RCM3209/RCM3229 operates over a voltage from 3.15 V to 3.45 V, but most RCM3209/RCM3229 input pins, except /RESET_IN, VRAM, VBAT_EXT, and the power-supply pins, are 5 V tolerant. When a 5 V signal is applied to 5 V tolerant pins, they present a high impedance even if the Rabbit power is off. The 5 V tolerant feature allows 5 V devices that have a suitable switching threshold to be connected directly to the RCM3209/RCM3229. This includes HCT family parts operated at 5 V that have an input threshold between 0.8 and 2 V.

NOTE: CMOS devices operated at 5 V that have a threshold at 2.5 V are not suitable for direct connection because the Rabbit 3000 outputs do not rise above VDD, and is often specified as 3.3 V. Although a CMOS input with a 2.5 V threshold may switch at 3.3 V, it will consume excessive current and switch slowly.

In order to translate between 5 V and 3.3 V, HCT family parts powered from 5 V can be used, and are often the best solution. There is also the “LVT” family of parts that operate from 2.0 V to 3.3 V, but that have 5 V tolerant inputs and are available from many suppliers. True level-translating parts are available with separate 3.3 V and 5 V supply pins, but these parts are not usually needed, and have design traps involving power sequencing.

4.2 Serial Communication

The RCM3209/RCM3229 boards do not have any serial protocol-level transceivers directly on the board. However, an RS-232 or RS-485 interface may be incorporated on the board the RCM3209/RCM3229 is mounted on. For example, the Prototyping Board has a standard RS-232 transceiver chip.

4.2.1 Serial Ports

There are six serial ports designated as Serial Ports A, B, C, D, E, and F. All six serial ports can operate in an asynchronous mode up to the baud rate of the system clock divided by 8. An asynchronous port can handle 7 or 8 data bits. A 9th bit address scheme, where an additional bit is sent to mark the first byte of a message, is also supported. Serial Ports A, B, C, and D can also be operated in the clocked serial mode. In this mode, a clock line synchronously clocks the data in or out. Either of the two communicating devices can supply the clock. When the Rabbit 3000 provides the clock, the baud rate can be up to 80% of the system clock frequency divided by 128, or 276,250 bps for a 44.2 MHz clock speed.

Serial Ports E and F can also be configured as SDLC/HDLC serial ports. The IrDA protocol is also supported in SDLC format by these two ports.

Serial Port A is available only on the programming port.

4.2.2 Ethernet Port (RCM3209 only)

Figure 8 shows the pinout for the RJ-45 Ethernet port (J4). Note that some Ethernet connectors are numbered in reverse to the order used here.

Figure 8. RJ-45 Ethernet Port Pinout

Three LEDs are placed next to the RJ-45 Ethernet jack, one to indicate an Ethernet link or Ethernet activity (**LNK/ACT**), and one (**FDX/COL**) to indicate whether the Ethernet connection is in full-duplex mode (steady on) or that a half-duplex connection is experiencing collisions (blinks).

The transformer/connector assembly ground is connected to the RCM3209 printed circuit board digital ground via a ferrite bead, L1, as shown in Figure 9.

Figure 9. Ferrite Bead Isolation

The RJ-45 connector is shielded to minimize EMI effects to/from the Ethernet signals.

The Ethernet chip supports auto MDI/MDIX on the Ethernet port to choose the Ethernet interface automatically based on whether a crossover cable or a straight-through cable is used in a particular setup. The Ethernet chip may spike the current draw by up to 200 mA while it is searching to determine the type of Ethernet cable. This search is repeated every second if no Ethernet cable is detected. If you do not plan to connect an Ethernet cable, use the Dynamic C `pd_powerdown()` function call to turn off the Ethernet chip. The `pd_powerup()` function call is available to turn the Ethernet chip back on at a later time. These function calls are described in the *Dynamic C TCP/IP User's Manual, Volume 1*.

4.2.3 Serial Programming Port

The RCM3209/RCM3229 serial programming port is accessed using header J1 or over an Ethernet connection via the RabbitLink EG2110. The programming port uses the Rabbit 3000's Serial Port A for communication. Dynamic C uses the programming port to download and debug programs.

The programming port is also used for the following operations.

- Cold-boot the Rabbit 3000 on the RCM3209/RCM3229 after a reset.
- Remotely download and debug a program over an Ethernet connection using the RabbitLink EG2110.
- Fast copy designated portions of flash memory from one Rabbit-based board (the master) to another (the slave) using the Rabbit Cloning Board.

In addition to Serial Port A, the Rabbit 3000 startup-mode (SMODE0, SMODE1), status, and reset pins are available on the programming port.

The two startup mode pins determine what happens after a reset—the Rabbit 3000 is either cold-booted or the program begins executing at address 0x0000.

The status pin is used by Dynamic C to determine whether a Rabbit microprocessor is present. The status output has three different programmable functions:

1. It can be driven low on the first op code fetch cycle.
2. It can be driven low during an interrupt acknowledge cycle.
3. It can also serve as a general-purpose CMOS output.

The /RESET_IN pin is an external input that is used to reset the Rabbit 3000 and the RCM3209/RCM3229 onboard peripheral circuits. The serial programming port can be used to force a hard reset on the RCM3209/RCM3229 by asserting the /RESET_IN signal.

Alternate Uses of the Serial Programming Port

All three clocked Serial Port A signals are available as

- a synchronous serial port
- an asynchronous serial port, with the clock line usable as a general CMOS I/O pin

The programming port may also be used as a serial port once the application is running. The SMODE pins may then be used as inputs and the status pin may be used as an output.

Refer to the *Rabbit 3000 Microprocessor User's Manual* for more information.

4.3 Serial Programming Cable

The programming cable is used to connect the serial programming port of the RCM3209/RCM3229 to a PC serial COM port. The programming cable converts the voltage levels used by the PC USB port to the CMOS voltage levels used by the Rabbit 3000.

When the **PROG** connector on the programming cable is connected to the RCM3209/RCM3229 serial programming port at header J1, programs can be downloaded and debugged over the serial interface.

The **DIAG** connector of the programming cable may be used on header J1 of the RCM3209/RCM3229 with the RCM3209/RCM3229 operating in the Run Mode. This allows the programming port to be used as a regular serial port.

4.3.1 Changing Between Program Mode and Run Mode

The RCM3209/RCM3229 is automatically in Program Mode when the **PROG** connector on the programming cable is attached, and is automatically in Run Mode when no programming cable is attached. When the Rabbit 3000 is reset, the operating mode is determined by the state of the SMODE pins. When the programming cable's **PROG** connector is attached, the SMODE pins are pulled high, placing the Rabbit 3000 in the Program Mode. When the programming cable's **PROG** connector is not attached, the SMODE pins are pulled low, causing the Rabbit 3000 to operate in the Run Mode.

Figure 10. Switching Between Program Mode and Run Mode

A program “runs” in either mode, but can only be downloaded and debugged when the RCM3209/RCM3229 is in the Program Mode.

Refer to the *Rabbit 3000 Microprocessor User’s Manual* for more information on the programming port.

4.3.2 Standalone Operation of the RCM3209/RCM3229

The RCM3209/RCM3229 must be programmed via the Prototyping Board or via a similar arrangement on a customer-supplied board. Once the RCM3209/RCM3229 has been programmed successfully, remove the serial programming cable from the programming connector and reset the RCM3209/RCM3229. The RCM3209/RCM3229 may be reset by cycling the power off/on or by pressing the **RESET** button on the Prototyping Board. The RCM3209/RCM3229 module may now be removed from the Prototyping Board for end-use installation.

CAUTION: Disconnect power to the Prototyping Board or other boards when removing or installing your RCM3209/RCM3229 module to protect against inadvertent shorts across the pins or damage to the RCM3209/RCM3229 if the pins are not plugged in correctly. Do not reapply power until you have verified that the RCM3209/RCM3229 module is plugged in correctly.

4.4 Other Hardware

4.4.1 Clock Doubler

The RCM3209/RCM3229 takes advantage of the Rabbit 3000 microprocessor's internal clock doubler. A built-in clock doubler allows half-frequency crystals to be used to reduce radiated emissions. The 44.2 MHz frequency specified for the RCM3209/RCM3229 is generated using a 22.12 MHz resonator.

The clock doubler may be disabled if 44.2 MHz clock speeds are not required. Disabling the Rabbit 3000 microprocessor's internal clock doubler will reduce power consumption and further reduce radiated emissions. The clock doubler is disabled with a simple configuration macro as shown below.

1. Select the "Defines" tab from the Dynamic C **Options > Project Options** menu.
2. Add the line `CLOCK_DOUBLED=0` to always disable the clock doubler.

The clock doubler is enabled by default, and usually no entry is needed. If you need to specify that the clock doubler is always enabled, add the line `CLOCK_DOUBLED=1` to always enable the clock doubler.

3. Click **OK** to save the macro. The clock doubler will now remain off whenever you are in the project file where you defined the macro.

4.4.2 Spectrum Spreader

The Rabbit 3000 features a spectrum spreader, which helps to mitigate EMI problems. By default, the spectrum spreader is on automatically, but it may also be turned off or set to a stronger setting. The means for doing so is through a simple configuration macro as shown below.

1. Select the "Defines" tab from the Dynamic C **Options > Project Options** menu.
2. Normal spreading is the default, and usually no entry is needed. If you need to specify normal spreading, add the line

```
ENABLE_SPREADER=1
```

For strong spreading, add the line

```
ENABLE_SPREADER=2
```

To disable the spectrum spreader, add the line

```
ENABLE_SPREADER=0
```

NOTE: The strong spectrum-spreading setting is unnecessary for the BL2000.

3. Click **OK** to save the macro. The spectrum spreader will now be set to the state specified by the macro value whenever you are in the project file where you defined the macro.

NOTE: Refer to the *Rabbit 3000 Microprocessor User's Manual* for more information on the spectrum-spreading setting and the maximum clock speed.

4.5 Memory

4.5.1 SRAM

The RCM3209/RCM3229 have 512K of program execution fast SRAM installed at U66. The RCM3209/RCM3229 data SRAM installed at U9 is 256K.

4.5.2 Flash EPROM

The RCM3209/RCM3229 boards also have 512K of flash EPROM at U8.

NOTE: Rabbit recommends that any customer applications should not be constrained by the sector size of the flash EPROM since it may be necessary to change the sector size in the future.

Writing to arbitrary flash memory addresses at run time is also discouraged. Instead, define a “user block” area to store persistent data. The functions `writeUserBlock()` and `readUserBlock()` are provided for this. Refer to the *Rabbit 3000 Microprocessor Designer’s Handbook* and the *Dynamic C Function Reference Manual* for additional information.

A Flash Memory Bank Select jumper configuration option based on 0 Ω surface-mounted resistors exists at header JP12 on the RCM3209/RCM3229 RabbitCore modules. This option, used in conjunction with some configuration macros, allows Dynamic C to compile two different co-resident programs for the upper and lower halves of a 256K flash in such a way that both programs start at logical address 0000. This option is not relevant to the RCM3209/RCM3229 RabbitCore modules, which use 512K flash memories.

4.5.3 Dynamic C BIOS Source Files

The Dynamic C BIOS source files handle different standard RAM and flash EPROM sizes automatically.

5. SOFTWARE REFERENCE

Dynamic C is an integrated development system for writing embedded software. It runs on an IBM-compatible PC and is designed for use with Rabbit with controllers based on the Rabbit microprocessor Chapter 5 provides the libraries and function calls related to the RCM3209/RCM3229.

5.1 More About Dynamic C

Dynamic C has been in use worldwide since 1989. It is specially designed for programming embedded systems, and features quick compile and interactive debugging in the real environment. A complete reference guide to Dynamic C is contained in the *Dynamic C User's Manual*.

You have a choice of doing your software development in the flash memory or in the data SRAM included on the RCM3209/RCM3229. The flash memory and SRAM options are selected with the **Options > Project Options > Compiler** menu.

The advantage of working in RAM is to save wear on the flash memory, which is limited to about 100,000 write cycles. The disadvantage is that the code and data might not both fit in RAM.

NOTE: An application should be run from the program execution SRAM after the programming cable is disconnected. Your final code must always be stored in flash memory for reliable operation. For RCM3209/RCM3229 modules running at 44.2 MHz, which have a fast program execution SRAM that is not battery-backed, you should select **Code and BIOS in Flash, Run in RAM** from the Dynamic C **Options > Project Options > Compiler** menu to store the code in flash and copy it to the fast program execution SRAM at run-time to take advantage of the faster clock speed. This option optimizes the performance of RCM3209/RCM3229 modules running at 44.2 MHz.

NOTE: Do not depend on the flash memory sector size or type. Due to the volatility of the flash memory market, the RCM3209/RCM3229 and Dynamic C were designed to accommodate flash devices with various sector sizes.

Developing software with Dynamic C is simple. Users can write, compile, and test C and assembly code without leaving the Dynamic C development environment. Debugging occurs while the application runs on the target. Alternatively, users can compile a program to an image file for later loading. Dynamic C runs on PCs under Windows 2000/NT and later—see Rabbit's Technical Note TN257, *Running Dynamic C® With Windows Vista®*, for

additional information if you are using a Dynamic C release prior to v. 9.60 under Windows Vista. Programs can be downloaded at baud rates of up to 460,800 bps after the program compiles.

Dynamic C has a number of standard features.

- Full-feature source and/or assembly-level debugger, no in-circuit emulator required.
- Royalty-free TCP/IP stack with source code and most common protocols.
- Hundreds of functions in source-code libraries and sample programs:
 - ▶ Exceptionally fast support for floating-point arithmetic and transcendental functions.
 - ▶ RS-232 and RS-485 serial communication.
 - ▶ Analog and digital I/O drivers.
 - ▶ I²C, SPI, GPS, file system.
 - ▶ LCD display and keypad drivers.
- Powerful language extensions for cooperative or preemptive multitasking
- Loader utility program to load binary images into Rabbit targets in the absence of Dynamic C.
- Provision for customers to create their own source code libraries and augment on-line help by creating “function description” block comments using a special format for library functions.
- Standard debugging features:
 - ▶ Breakpoints—Set breakpoints that can disable interrupts.
 - ▶ Single-stepping—Step into or over functions at a source or machine code level, μ C/OS-II aware.
 - ▶ Code disassembly—The disassembly window displays addresses, opcodes, mnemonics, and machine cycle times. Switch between debugging at machine-code level and source-code level by simply opening or closing the disassembly window.
 - ▶ Watch expressions—Watch expressions are compiled when defined, so complex expressions including function calls may be placed into watch expressions. Watch expressions can be updated with or without stopping program execution.
 - ▶ Register window—All processor registers and flags are displayed. The contents of general registers may be modified in the window by the user.
 - ▶ Stack window—shows the contents of the top of the stack.
 - ▶ Hex memory dump—displays the contents of memory at any address.
 - ▶ **STDIO** window—`printf` outputs to this window and keyboard input on the host PC can be detected for debugging purposes. `printf` output may also be sent to a serial port or file.

5.2 Dynamic C Function Calls

5.2.1 Digital I/O

The RCM3209/RCM3229 was designed to interface with other systems, and so there are no drivers written specifically for the I/O. The general Dynamic C read and write functions allow you to customize the parallel I/O to meet your specific needs. For example, use

```
WrPortI(PEDDR, &PEDDRShadow, 0x00);
```

to set all the Port E bits as inputs, or use

```
WrPortI(PEDDR, &PEDDRShadow, 0xFF);
```

to set all the Port E bits as outputs.

When using the external I/O bus on the Rabbit 3000 chip, add the line

```
#define PORTA_AUX_IO // required to enable external I/O bus
```

to the beginning of any programs using the external I/O bus.

The sample programs in the Dynamic C **SAMPLES/RCM3200** directory provide further examples.

5.2.2 SRAM Use

The RCM3209/RCM3229 has a battery-backed data SRAM and a program-execution SRAM. Dynamic C provides the **protected** keyword to identify variables that are to be placed into the battery-backed SRAM. The compiler generates code that creates a backup copy of a protected variable before the variable is modified. If the system resets while the protected variable is being modified, the variable's value can be restored when the system restarts.

The sample code below shows how a protected variable is defined and how its value can be restored.

```
protected nf_device nandFlash;
int main() {
    ...
    _sysIsSoftReset(); // restore any protected variables
```

The **bbram** keyword may also be used instead if there is a need to store a variable in battery-backed SRAM without affecting the performance of the application program. Data integrity is *not* assured when a reset or power failure occurs during the update process.

Additional information on **bbram** and **protected** variables is available in the *Dynamic C User's Manual*.

5.2.3 Serial Communication Drivers

Library files included with Dynamic C provide a full range of serial communications support. The `LIB\RS232.LIB` library provides a set of circular-buffer-based serial functions. The `LIB\PACKET.LIB` library provides packet-based serial functions where packets can be delimited by the 9th bit, by transmission gaps, or with user-defined special characters. Both libraries provide blocking functions, which do not return until they are finished transmitting or receiving, and nonblocking functions, which must be called repeatedly until they are finished. For more information, see the *Dynamic C Function Reference Manual* and Rabbit's Technical Note 213, *Rabbit 2000 Serial Port Software* in the online documentation set.

5.2.4 TCP/IP Drivers

The TCP/IP drivers are located in the `LIB\TCP/IP` directory.

Complete information on these libraries and the TCP/IP functions is provided in the *Dynamic C TCP/IP User's Manual*.

5.2.5 Prototyping Board Function Calls

The functions described in this section are for use with the Prototyping Board features. The source code is in the `RCM3200.LIB` library in the Dynamic C `SAMPLES\RCM3200` folder if you need to modify it for your own board design.

Other generic functions applicable to all devices based on Rabbit microprocessors are described in the *Dynamic C Function Reference Manual*.

5.2.6 Prototyping Board Functions

The functions described in this section are for use with the Prototyping Board features. The source code is in the Dynamic C `SAMPLES\RCM3200\RCM3200.LIB` library if you need to modify it for your own board design.

Other generic functions applicable to all devices based on Rabbit microprocessors are described in the *Dynamic C Function Reference Manual*.

5.2.6.1 Board Initialization

`brdInit`

```
void brdInit (void);
```

DESCRIPTION

Call this function at the beginning of your program. This function initializes Parallel Ports A through G for use with the Prototyping Board.

This function call is intended for demonstration purposes only, and can be modified for your applications.

Summary of Initialization

1. I/O port pins are configured for Prototyping Board operation.
2. Unused configurable I/O are set as tied inputs or outputs.
3. Only one RabbitCore module is plugged in, and is in the **MASTER** position on the Prototyping Board.
4. The LCD/keypad module is disabled.
5. RS-485 is not enabled.
6. RS-232 is not enabled.
7. The IrDA transceiver is disabled.
8. LEDs are off.

RETURN VALUE

None.

5.3 Upgrading Dynamic C

Dynamic C patches that focus on bug fixes are available from time to time. Check the Web site www.rabbit.com/support/ for the latest patches, workarounds, and bug fixes.

5.3.1 Extras

Dynamic C installations are designed for use with the board they are included with, and are included at no charge as part of our low-cost kits.

Starting with Dynamic C version 9.60, which is included with the RCM3209/RCM3229 Development Kit, Dynamic C includes the popular μ C/OS-II real-time operating system, point-to-point protocol (PPP), FAT file system, RabbitWeb, and other select libraries. Rabbit also offers for purchase the Rabbit Embedded Security Pack featuring the Secure Sockets Layer (SSL) and a specific Advanced Encryption Standard (AES) library.

In addition to the Web-based technical support included at no extra charge, a one-year telephone-based technical support subscription is also available for purchase.

Visit our Web site at www.rabbit.com for further information and complete documentation.

6. USING THE TCP/IP FEATURES

6.1 TCP/IP Connections

Programming and development can be done with the RCM3209 RabbitCore modules without connecting the Ethernet port to a network. However, if you will be running the sample programs that use the Ethernet capability or will be doing Ethernet-enabled development, you should connect the RCM3209 module's Ethernet port at this time.

Before proceeding you will need to have the following items.

- If you don't have Ethernet access, you will need at least a 10Base-T Ethernet card (available from your favorite computer supplier) installed in a PC.
- One Cat. 5 straight through or crossover Ethernet cable.

Ethernet cables and a 10Base-T Ethernet hub are available in a TCP/IP tool kit. More information is available at www.rabbit.com.

NOTE: Although 10Base-T is the minimum required, 10/100Base-T or 100Base-T is recommended to allow you to work with the full speed capabilities of the RCM3209.

1. Connect the AC adapter and the programming cable as shown in Section 2.2.2, "Step 2 — Connect Programming Cable."
2. Ethernet Connections

There are four options for connecting the RCM3209 module to a network for development and runtime purposes. The first two options permit total freedom of action in selecting network addresses and use of the "network," as no action can interfere with other users. We recommend one of these options for initial development.

- **No LAN** — The simplest alternative for desktop development. Connect the RCM3209's module's Ethernet port directly to the PC's network interface card using either a Cat. 5 *crossover* cable or a Cat. 5 *straight-through* cable.
- **Micro-LAN** — Another simple alternative for desktop development. Use a small Ethernet 10Base-T hub and connect both the PC's network interface card and the RCM3209's Ethernet port to it, using standard network cables.

The following options require more care in address selection and testing actions, as conflicts with other users, servers and systems can occur:

- **LAN** — Connect the RCM3209's Ethernet port to an existing LAN, preferably one to which the development PC is already connected. You will need to obtain IP addressing information from your network administrator.
- **WAN** — The RCM3209 is capable of direct connection to the Internet and other Wide Area Networks, but exceptional care should be used with IP address settings and all network-related programming and development. We recommend that development and debugging be done on a local network before connecting a RabbitCore system to the Internet.

TIP: Checking and debugging the initial setup on a micro-LAN is recommended before connecting the system to a LAN or WAN.

The PC running Dynamic C through the serial port on the RCM3209 does not need to be the PC with the Ethernet card.

3. Apply Power

Plug in the AC adapter. The RCM3209 module is now ready to be used.

6.2 TCP/IP Primer on IP Addresses

Obtaining IP addresses to interact over an existing, operating, network can involve a number of complications, and must usually be done with cooperation from your ISP and/or network systems administrator. For this reason, it is suggested that the user begin instead by using a direct connection between a PC and the RCM3209 board.

In order to set up this direct connection, the user will have to use a PC without networking, or disconnect a PC from the corporate network, or install a second Ethernet adapter and set up a separate private network attached to the second Ethernet adapter. Disconnecting your PC from the corporate network may be easy or nearly impossible, depending on how it is set up. If your PC boots from the network or is dependent on the network for some or all of its disks, then it probably should not be disconnected. If a second Ethernet adapter is used, be aware that Windows TCP/IP will send messages to one adapter or the other, depending on the IP address and the binding order in Microsoft products. Thus you should have different ranges of IP addresses on your private network from those used on the corporate network. If both networks service the same IP address, then Windows may send a packet intended for your private network to the corporate network. A similar situation will take place if you use a dial-up line to send a packet to the Internet. Windows may try to send it via the local Ethernet network if it is also valid for that network.

The following IP addresses are set aside for local networks and are not allowed on the Internet: 10.0.0.0 to 10.255.255.255, 172.16.0.0 to 172.31.255.255, and 192.168.0.0 to 192.168.255.255.

The RCM3209 board uses a 10/100Base-T type of Ethernet connection, which is the most common scheme. The RJ-45 connectors are similar to U.S. style telephone connectors, are except larger and have 8 contacts.

An alternative to the direct connection is a connection using a hub. The hub relays packets received on any port to all of the ports on the hub. Hubs are low in cost and are readily available. The RCM3209 board uses 10/100 Mbps Ethernet, so the hub or Ethernet adapter should be a 10/100 Mbps unit.

In a corporate setting where the Internet is brought in via a high-speed line, there are typically machines between the outside Internet and the internal network. These machines include a combination of proxy servers and firewalls that filter and multiplex Internet traffic. In the configuration below, the RCM3209 board could be given a fixed address so any of the computers on the local network would be able to contact it. It may be possible to configure the firewall or proxy server to allow hosts on the Internet to directly contact the controller, but it would probably be easier to place the controller directly on the external network outside of the firewall. This avoids some of the configuration complications by sacrificing some security.

If your system administrator can give you an Ethernet cable along with its IP address, the netmask and the gateway address, then you may be able to run the sample programs without having to setup a direct connection between your computer and the RCM3209 board. You will also need the IP address of the nameserver, the name or IP address of your mail server, and your domain name for some of the sample programs.

6.2.1 IP Addresses Explained

IP (Internet Protocol) addresses are expressed as 4 decimal numbers separated by periods, for example:

216.103.126.155

10.1.1.6

Each decimal number must be between 0 and 255. The total IP address is a 32-bit number consisting of the 4 bytes expressed as shown above. A local network uses a group of adjacent IP addresses. There are always 2^N IP addresses in a local network. The netmask (also called subnet mask) determines how many IP addresses belong to the local network. The netmask is also a 32-bit address expressed in the same form as the IP address. An example netmask is:

255.255.255.0

This netmask has 8 zero bits in the least significant portion, and this means that 2^8 addresses are a part of the local network. Applied to the IP address above (216.103.126.155), this netmask would indicate that the following IP addresses belong to the local network:

216.103.126.0

216.103.126.1

216.103.126.2

etc.

216.103.126.254

216.103.126.255

The lowest and highest address are reserved for special purposes. The lowest address (216.102.126.0) is used to identify the local network. The highest address (216.102.126.255) is used as a broadcast address. Usually one other address is used for the address of the gateway out of the network. This leaves $256 - 3 = 253$ available IP addresses for the example given.

6.2.2 How IP Addresses are Used

The actual hardware connection via an Ethernet uses Ethernet adapter addresses (also called MAC addresses). These are 48-bit addresses and are unique for every Ethernet adapter manufactured. In order to send a packet to another computer, given the IP address of the other computer, it is first determined if the packet needs to be sent directly to the other computer or to the gateway. In either case, there is an IP address on the local network to which the packet must be sent. A table is maintained to allow the protocol driver to determine the MAC address corresponding to a particular IP address. If the table is empty, the MAC address is determined by sending an Ethernet broadcast packet to all devices on the local network asking the device with the desired IP address to answer with its MAC address. In this way, the table entry can be filled in. If no device answers, then the device is nonexistent or inoperative, and the packet cannot be sent.

IP addresses are arbitrary and can be allocated as desired provided that they don't conflict with other IP addresses. However, if they are to be used with the Internet, then they must be numbers that are assigned to your connection by proper authorities, generally by delegation via your service provider.

Each RCM3209 RabbitCore module has its own unique MAC address, which consists of the prefix 0090C2 followed by the code that appears on the label affixed to the RCM3209 module. For example, a MAC address might be 0090C2C002C0.

TIP: You can always verify the MAC address on your board by running the sample program `DISPLAY_MAC.C` from the `SAMPLES\TCPIP` folder.

6.2.3 Dynamically Assigned Internet Addresses

In many instances, devices on a network do not have fixed IP addresses. This is the case when, for example, you are assigned an IP address dynamically by your dial-up Internet service provider (ISP) or when you have a device that provides your IP addresses using the Dynamic Host Configuration Protocol (DHCP). The RCM3209 RabbitCore modules can use such IP addresses to send and receive packets on the Internet, but you must take into account that this IP address may only be valid for the duration of the call or for a period of time, and could be a private IP address that is not directly accessible to others on the Internet. These addresses can be used to perform some Internet tasks such as sending e-mail or browsing the Web, but it is more difficult to participate in conversations that originate elsewhere on the Internet. If you want to find out this dynamically assigned IP address, under Windows 98 you can run the `winiipcfg` program while you are connected and look at the interface used to connect to the Internet.

Many networks use private IP addresses that are assigned using DHCP. When your computer comes up, and periodically after that, it requests its networking information from a DHCP server. The DHCP server may try to give you the same address each time, but a fixed IP address is usually not guaranteed.

If you are not concerned about accessing the RCM3209 from the Internet, you can place the RCM3209 on the internal network using a private address assigned either statically or through DHCP.

6.3 Placing Your Device on the Network

In many corporate settings, users are isolated from the Internet by a firewall and/or a proxy server. These devices attempt to secure the company from unauthorized network traffic, and usually work by disallowing traffic that did not originate from inside the network. If you want users on the Internet to communicate with your RCM3209, you have several options. You can either place the RCM3209 directly on the Internet with a real Internet address or place it behind the firewall. If you place the RCM3209 behind the firewall, you need to configure the firewall to translate and forward packets from the Internet to the RCM3209.

6.4 Running TCP/IP Sample Programs

We have provided a number of sample programs demonstrating various uses of TCP/IP for networking embedded systems. These programs require you to connect your PC and the RCM3209 board together on the same network. This network can be a local private network (preferred for initial experimentation and debugging), or a connection via the Internet.

6.4.1 How to Set IP Addresses in the Sample Programs

With the introduction of Dynamic C 7.30 we have taken steps to make it easier to run many of our sample programs. Instead of the **MY_IP_ADDRESS** and other macros, you will see a **TCPCONFIG** macro. This macro tells Dynamic C to select your configuration from a list of default configurations. You will have three choices when you encounter a sample program with the **TCPCONFIG** macro.

1. You can replace the **TCPCONFIG** macro with individual **MY_IP_ADDRESS**, **MY_NETMASK**, **MY_GATEWAY**, and **MY_NAMESERVER** macros in each program.
2. You can leave **TCPCONFIG** at the usual default of 1, which will set the IP configurations to **10.10.6.100**, the netmask to **255.255.255.0**, and the nameserver and gateway to **10.10.6.1**. If you would like to change the default values, for example, to use an IP address of **10.1.1.2** for the RCM3209 board, and **10.1.1.1** for your PC, you can edit the values in the section that directly follows the “General Configuration” comment in the **TCP_CONFIG.LIB** library. You will find this library in the **LIB/TCP/IP** directory.
3. You can create a **CUSTOM_CONFIG.LIB** library and use a **TCPCONFIG** value greater than 100. Instructions for doing this are at the beginning of the **TCP_CONFIG.LIB** file.

There are some other “standard” configurations for **TCPCONFIG** that let you select different features such as DHCP. Their values are documented at the top of the **TCP_CONFIG.LIB** library. More information is available in the *Dynamic C TCP/IP User’s Manual*.

6.4.2 How to Set Up your Computer for Direct Connect

Follow these instructions to set up your PC or notebook. Check with your administrator if you are unable to change the settings as described here since you may need administrator privileges. The instructions are specifically for Windows 2000, but the interface is similar for other versions of Windows.

TIP: If you are using a PC that is already on a network, you will disconnect the PC from that network to run these sample programs. Write down the existing settings before changing them to facilitate restoring them when you are finished with the sample programs and reconnect your PC to the network.

1. Go to the control panel (**Start > Settings > Control Panel**), and then double-click the Network icon.
2. Select the network interface card used for the Ethernet interface you intend to use (e.g., **TCP/IP Xircom Credit Card Network Adapter**) and click on the “Properties” button. Depending on which version of Windows your PC is running, you may have to select the “Local Area Connection” first, and then click on the “Properties” button to bring up the Ethernet interface dialog. Then “Configure” your interface card for a “10Base-T Half-Duplex” or an “Auto-Negotiation” connection on the “Advanced” tab.

NOTE: Your network interface card will likely have a different name.

3. Now select the **IP Address** tab, and check **Specify an IP Address**, or select TCP/IP and click on “Properties” to assign an IP address to your computer (this will disable “obtain an IP address automatically”):

IP Address : 10.10.6.101
Netmask : 255.255.255.0
Default gateway : 10.10.6.1

4. Click **<OK>** or **<Close>** to exit the various dialog boxes.

6.5 Run the `PINGME.C` Sample Program

Connect a Cat. 5 Ethernet cable from your computer's Ethernet port to the RCM3209 board's RJ-45 Ethernet connector. Open this sample program from the `SAMPLES\TCPIP\ICMP` folder, compile the program, and start it running under Dynamic C. When the program starts running, the green **LNK/ACT** LED on the RCM3209 board should be on to indicate an Ethernet connection is made. (Note: If the **LNK/ACT** LED does not light, and you are using a hub, check that the power is not off on the hub.)

The next step is to ping the board from your PC. This can be done by bringing up the MS-DOS window and running the pingme program:

```
ping 10.10.6.100
```

or by **Start > Run**

and typing the entry

```
ping 10.10.6.100
```

Notice that the green **LNK/ACT** LED flashes on the RCM3209 board while the ping is taking place, and indicates the transfer of data. The ping routine will ping the board four times and write a summary message on the screen describing the operation.

6.6 Running More Sample Programs With Direct Connect

The sample programs discussed here are in the Dynamic C `SAMPLES\RCM3209\TCPIP` folder.

- **BROWSELED.C**—This program demonstrates a basic controller running a Web page. Two “LEDs” are created on the Web page, and two buttons on the Prototyping Board then toggle them. Users can change the state of the lights from the Web browser. The LEDs on the Prototyping Board match the ones on the Web page. As long as you have not modified the `TCPCONFIG 1` macro in the sample program, enter the following server address in your Web browser to bring up the Web page served by the sample program.

```
http://10.10.6.100.
```

Otherwise use the TCP/IP settings you entered in the `TCP_CONFIG.LIB` library.

- **ECHOCLIENT.C**—This program demonstrates a basic client that will send a packet and wait for the connected server to echo it back. After every number of sends and receives, transfer times are shown in the **STDIO** window.

Use **ECHO_SERVER.C** to program a server controller.

- **ECHOSERVER.C**—This program demonstrates a basic server that will echo back any data sent from a connected client.

Use **ECHO_CLIENT.C** to program a client controller.

- **ENET_AD.C**—This program demonstrates Ethernet communication between two single-board computers. The program sends an A/D voltage value to the second single-board computer via Ethernet for display.

Use **ENET_MENU.C** to program the other single-board computer.

- **ENET_MENU.C**—This program demonstrates how to implement a menu system using a highlight bar on a graphic LCD display and to communicate it to another single-board computer via Ethernet.

Use **ENET_AD.C** to program the other single-board computer with analog inputs and outputs.

- **MBOXDEMO.C**—Implements a Web server that allows e-mail messages to be entered and then shown on the LCD/keypad module.
- **SMTP.C**—This program allows you to send an E-mail when a switch on the Prototyping Board is pressed. Follow the instructions included with the sample program.
- **PINGLED.C**—This program demonstrates ICMP by pinging a remote host. It will flash LEDs DS1 and DS2 on the Prototyping Board when a ping is sent and received.

6.7 Where Do I Go From Here?

NOTE: If you purchased your RCM3209 through a distributor or through a Rabbit partner, contact the distributor or partner first for technical support.

If there are any problems at this point:

- Use the Dynamic C **Help** menu to get further assistance with Dynamic C.
- Check the Rabbit Technical Bulletin Board and forums at www.rabbit.com/support/bb/ and at www.rabbit.com/forums/.
- Use the Technical Support e-mail form at www.rabbit.com/support/.

If the sample programs ran fine, you are now ready to go on.

Additional sample programs are described in the *Dynamic C TCP/IP User's Manual*.

Please refer to the *Dynamic C TCP/IP User's Manual* to develop your own applications. *An Introduction to TCP/IP* provides background information on TCP/IP, and is available on the CD and on our [Web site](#).

APPENDIX A. RCM3209/RCM3229 SPECIFICATIONS

Appendix A provides the specifications for the RCM3209/
RCM3229, and describes the conformal coating.

A.1 Electrical and Mechanical Characteristics

Figure A-1 shows the mechanical dimensions for the RCM3209/RCM3229.

Figure A-1. RCM3209/RCM3229 Dimensions

NOTE: All measurements are in inches followed by millimeters enclosed in parentheses.
All dimensions have a manufacturing tolerance of ± 0.01 " (0.25 mm).

It is recommended that you allow for an “exclusion zone” of 0.04" (1 mm) around the RCM3209/RCM3229 in all directions (except above the RJ-45 plug) when the RCM3209/RCM3229 is incorporated into an assembly that includes other printed circuit boards. This “exclusion zone” that you keep free of other components and boards will allow for sufficient air flow, and will help to minimize any electrical or electromagnetic interference between adjacent boards. An “exclusion zone” of 0.08" (2 mm) is recommended below the RCM3209/RCM3229 when the RCM3209/RCM3229 is plugged into another assembly using the shortest connectors for headers J61 and J62. Figure A-2 shows this “exclusion zone.”

Figure A-2. RCM3209/RCM3229 “Exclusion Zone”

Table A-1 lists the electrical, mechanical, and environmental specifications for the RCM3209/RCM3229.

Table A-1. RabbitCore RCM3209/RCM3229 Specifications

Feature	RCM3209	RCM3229
Microprocessor	Rabbit 3000 [®] at 44.2 MHz	
EMI Reduction	Spectrum spreader for reduced EMI (radiated emissions)	
Ethernet Port	10/100Base-T, RJ-45, 3 LEDs	—
Flash Memory	512K	
Data SRAM	256K	
Program Execution SRAM	512K	
Backup Battery	Connection for user-supplied backup battery (to support RTC and data SRAM)	
General-Purpose I/O	52 parallel digital I/O lines: <ul style="list-style-type: none"> • 44 configurable I/O • 4 fixed inputs • 4 fixed outputs 	
Additional Inputs	Startup mode (2), reset in	
Additional Outputs	Status, reset out	
External I/O Bus	Can be configured for 8 data lines and 6 address lines (shared with parallel I/O lines), plus I/O read/write	
Serial Ports	6 shared high-speed, CMOS-compatible ports: <ul style="list-style-type: none"> • all 6 configurable as asynchronous (with IrDA), 4 as clocked serial (SPI), and 2 as SDLC/HDLC (with IrDA) • 1 asynchronous serial port dedicated for programming • support for MIR/SIR IrDA transceiver 	
Serial Rate	Maximum asynchronous baud rate = CLK/8	
Slave Interface	A slave port allows the RCM3209/RCM3229 to be used as an intelligent peripheral device slaved to a master processor, which may either be another Rabbit 3000 or any other type of processor	
Real-Time Clock	Yes	
Timers	Ten 8-bit timers (6 cascadable), one 10-bit timer with 2 match registers	
Watchdog/Supervisor	Yes	
Pulse-Width Modulators	10-bit free-running counter and four pulse-width registers	
Input Capture	2- channel input capture can be used to time input signals from various port pins	
Quadrature Decoder	2-channel quadrature decoder accepts inputs from external incremental encoder modules	

Table A-1. RabbitCore RCM3209/RCM3229 Specifications (continued)

Feature	RCM3209	RCM3229
Power	3.15 V to 3.45 V DC 325 mA @ 3.3 V	3.15 V to 3.45 V DC 190 mA @ 3.3 V
Operating Temperature	-40°C to +85°C	
Humidity	5% to 95%, noncondensing	
Connectors	Two 2 × 17, 2 mm pitch	
Board Size	1.850" × 2.725" × 0.86" (47 mm × 69 mm × 22 mm)	

A.1.1 Headers

The RCM3209/RCM3229 uses headers at J61 and J62 for physical connection to other boards. J61 and J62 are 2 × 17 SMT headers with a 2 mm pin spacing. J1, the programming port, is a 2 × 5 header with a 1.27 mm pin spacing.

Figure A-3 shows the layout of another board for the RCM3209/RCM3229 to be plugged into. These values are relative to the mounting hole.

A.1.2 Physical Mounting

A 9/32" (7 mm) standoff with a 2-56 screw is recommended to attach the RCM3209/RCM3229 to a user board at the hole position shown in Figure A-3. Either use plastic hardware, or use insulating washers to keep any metal hardware from shorting out signals on the RCM3209/RCM3229.

A.2 Bus Loading

You must pay careful attention to bus loading when designing an interface to the RCM3209/RCM3229. This section provides bus loading information for external devices.

Table A-2 lists the capacitance for the various RCM3209/RCM3229 I/O ports.

Table A-2. Capacitance of Rabbit 3000 I/O Ports

I/O Ports	Input Capacitance (pF)	Output Capacitance (pF)
Parallel Ports A to G	12	14

Table A-3 lists the external capacitive bus loading for the various RCM3209/RCM3229 output ports. Be sure to add the loads for the devices you are using in your custom system and verify that they do not exceed the values in Table A-3.

Table A-3. External Capacitive Bus Loading -40°C to +70°C

Output Port	Clock Speed (MHz)	Maximum External Capacitive Loading (pF)
All I/O lines with clock doubler enabled	44.2	100

Figure A-4 shows a typical timing diagram for the Rabbit 3000 microprocessor external I/O read and write cycles.

Figure A-4. I/O Read and Write Cycles—No Extra Wait States

NOTE: /IOCSx can be programmed to be active low (default) or active high.

Table A-4 lists the delays in gross memory access time for $V_{DD} = 3.3$ V.

Table A-4. Data and Clock Delays $V_{DD} \pm 10\%$, Temp, -40°C – $+85^{\circ}\text{C}$ (maximum)

VDD	Clock to Address Output Delay (ns)			Data Setup Time Delay (ns)	Spectrum Spreader Delay (ns)	
	30 pF	60 pF	90 pF		Normal dbl/no dbl	Strong dbl/no dbl
3.3	6	8	11	1	3/4.5	4.5/9

The measurements are taken at the 50% points under the following conditions.

- $T = -40^{\circ}\text{C}$ to 85°C , $V = V_{DD} \pm 10\%$
- Internal clock to nonloaded CLK pin delay ≤ 1 ns @ $85^{\circ}\text{C}/3.0$ V

The clock to address output delays are similar, and apply to the following delays.

- T_{adr} , the clock to address delay
- T_{CSx} , the clock to memory chip select delay
- T_{IOCSx} , the clock to I/O chip select delay
- T_{IORD} , the clock to I/O read strobe delay
- T_{IOWR} , the clock to I/O write strobe delay
- T_{BUFEN} , the clock to I/O buffer enable delay

The data setup time delays are similar for both T_{setup} and T_{hold} .

When the spectrum spreader is enabled with the clock doubler, every other clock cycle is shortened (sometimes lengthened) by a maximum amount given in the table above. The shortening takes place by shortening the high part of the clock. If the doubler is not enabled, then every clock is shortened during the low part of the clock period. The maximum shortening for a pair of clocks combined is shown in the table.

Technical Note TN227, *Interfacing External I/O with Rabbit 2000/3000 Designs*, contains suggestions for interfacing I/O devices to the Rabbit 3000 microprocessors.

A.3 Rabbit 3000 DC Characteristics

Table A-5 outlines the DC characteristics for the Rabbit at 3.3 V over the recommended operating temperature range from $T_a = -55^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{DD} = 3.0\text{ V}$ to 3.6 V .

Table A-5. 3.3 Volt DC Characteristics

Symbol	Parameter	Test Conditions	Min	Typ	Max	Units
I_{IH}	Input Leakage High	$V_{IN} = V_{DD}$, $V_{DD} = 3.3\text{ V}$			1	μA
I_{IL}	Input Leakage Low (no pull-up)	$V_{IN} = V_{SS}$, $V_{DD} = 3.3\text{ V}$	-1			μA
I_{OZ}	Output Leakage (no pull-up)	$V_{IN} = V_{DD}$ or V_{SS} , $V_{DD} = 3.3\text{ V}$	-1		1	μA
V_{IL}	CMOS Input Low Voltage				$0.3 \times V_{DD}$	V
V_{IH}	CMOS Input High Voltage		$0.7 \times V_{DD}$			V
V_T	CMOS Switching Threshold	$V_{DD} = 3.3\text{ V}$, 25°C		1.65		V
V_{OL}	Low-Level Output Voltage	$I_{OL} = \text{See (sinking)}$ $V_{DD} = 3.0\text{ V}$			0.4	V
V_{OH}	High-Level Output Voltage	$I_{OH} = \text{See (sourcing)}$ $V_{DD} = 3.0\text{ V}$	$0.7 \times V_{DD}$			V

A.4 I/O Buffer Sourcing and Sinking Limit

Unless otherwise specified, the Rabbit I/O buffers are capable of sourcing and sinking 6.8 mA of current per pin at full AC switching speed. Full AC switching assumes a 29.4 MHz CPU clock and capacitive loading on address and data lines of less than 70 pF per pin. The absolute maximum operating voltage on all I/O is 5.5 V.

Table A-6 shows the AC and DC output drive limits of the parallel I/O buffers when the Rabbit 3000 is used in the RCM3209/RCM3229.

Table A-6. I/O Buffer Sourcing and Sinking Capability

Pin Name	Output Drive (Full AC Switching) Sourcing/Sinking Limits (mA)	
	Sourcing	Sinking
All data, address, and I/O lines with clock doubler enabled	6.8	6.8

Under certain conditions, you can exceed the limits outlined in Table A-7. See the *Rabbit 3000 Microprocessor User's Manual* for additional information.

A.5 Jumper Configurations

Figure A-5 shows the header locations used to configure the various RCM3209/RCM3229 options via jumpers.

Figure A-5. Location of RCM3209/RCM3229 Configurable Positions

Table A-7 lists the configuration options.

Table A-7. RCM3209/RCM3229 Jumper Configurations

Header	Description	Pins Connected		Factory Default
JP1	Serial Flash Chip Enable Indicator	1-2		n.c.
JP2	ACT or PD1 Output on J61 pin 34	1-2	ACT	×
		2-3	PD1	
JP3	LINK or PD0 Output on J61 pin 33	1-2	LINK	×
		2-3	PD0	
JP4	ENET or PE0 Output on J62 pin 19	1-2	ENET	
		2-3	PE0	×
JP5	NAND Flash Chip Enable	1-2	Reserved for future use	n.c.
		2-3	PD1 controls NAND Flash	

Table A-7. RCM3209/RCM3229 Jumper Configurations

Header	Description	Pins Connected		Factory Default
JP7	PD6 or TPI- Input on J61 pin 31	1-2	TPI-	
		2-3	PD6	×
JP8	PD7 or TPI+ Input on J61 pin 32	1-2	TPI+	
		2-3	PD7	×
JP9	PD2 or TPO- Output on J61 pin 29	1-2	TPO-	
		2-3	PD2	×
JP10	PD3 or TPO+ Output on J61 pin 30	1-2	TPO+	
		2-3	PD3	×
JP11	Flash Memory Size	1-2	256K	
		2-3	512K	×
JP12	Flash Memory Bank Select	1-2	Normal Mode	×
		2-3	Bank Mode	
JP13	Data SRAM Size	1-2	256K	×
		2-3	512K	
JP14	LED DS1 Display	1-2	FDX/COL displayed by LED DS1	×
		2-3	Optional ACT displayed by LED DS1	

NOTE: The jumper connections are made using 0 Ω surface-mounted resistors.

A.6 Conformal Coating

The areas around the 32 kHz real-time clock crystal oscillator has had the Dow Corning silicone-based 1-2620 conformal coating applied. The conformally coated area is shown in Figure A-6. The conformal coating protects these high-impedance circuits from the effects of moisture and contaminants over time.

Figure A-6. RCM3209/RCM3229 Areas Receiving Conformal Coating

Any components in the conformally coated area may be replaced using standard soldering procedures for surface-mounted components. A new conformal coating should then be applied to offer continuing protection against the effects of moisture and contaminants.

NOTE: For more information on conformal coatings, refer to Rabbit's Technical Note TN303, *Conformal Coatings*, in the online documentation.

APPENDIX B. PROTOTYPING BOARD

Appendix B describes the features and accessories of the Prototyping Board, and explains the use of the Prototyping Board to demonstrate the RCM3209/RCM3229 and to build prototypes of your own circuits.

B.1 Introduction

The Prototyping Board included in the Development Kit makes it easy to connect an RCM3209/RCM3229 module to a power supply and a PC workstation for development. It also provides some basic I/O peripherals (switches and LEDs), as well as a prototyping area for more advanced hardware development.

For the most basic level of evaluation and development, the Prototyping Board can be used without modification.

As you progress to more sophisticated experimentation and hardware development, modifications and additions can be made to the board without modifying or damaging the RCM3209/RCM3229 module itself.

The Prototyping Board is shown below in Figure B-1, with its main features identified.

Figure B-1. Prototyping Board

B.1.1 Prototyping Board Features

- **Power Connection**—A power-supply jack and a 3-pin header are provided for connection to the power supply. Note that the 3-pin header is symmetrical, with both outer pins connected to ground and the center pin connected to the raw V+ input. The cable of the AC adapter provided with Development Kit ends in a 3-pin plug that connects to the 3-pin header (J9)—the center pin of J9 is always connected to the positive terminal, and either edge pin is negative.

Users providing their own power supply should ensure that it delivers 8–24 V DC at 8 W. The voltage regulators will get warm while in use.

- **Regulated Power Supply**—The raw DC voltage provided at the POWER IN jack is routed to a 5 V switching voltage regulator, then to a separate 3.3 V linear regulator. The regulators provide stable power to the RCM3209/RCM3229 module and the Prototyping Board.
- **Power LED**—The power LED lights whenever power is connected to the Prototyping Board.
- **Reset Switch**—A momentary-contact, normally open switch is connected directly to the RCM3209/RCM3229's `/RESET_IN` pin. Pressing the switch forces a hardware reset of the system.
- **I/O Switches and LEDs**—Two momentary-contact, normally open switches are connected to the PG0 and PG1 pins of the master RCM3209/RCM3229 module and may be read as inputs by sample applications.

Two LEDs are connected to the PG6 and PG7 pins of the master module, and may be driven as output indicators by sample applications.

- **Prototyping Area**—A generous prototyping area has been provided for the installation of through-hole components. +3.3 V, +5 V, and Ground buses run around the edge of this area. Several areas for surface-mount devices are also available. (Note that there are SMT device pads on both top and bottom of the Prototyping Board.) Each SMT pad is connected to a hole designed to accept a 30 AWG solid wire.
- **Master Module Connectors**—A set of connectors is pre-wired to permit installation of the first RCM3000, RCM3100, or RCM3209/RCM3229 module that serves as the primary or “master module.”
- **Slave Module Connectors**—A second set of connectors is pre-wired to permit installation of a second, slave RCM3209/RCM3229, RCM3100, or RCM3000 module. This capability is reserved for future use, although the schematics in this manual contain all of the details an experienced developer will need to implement a master-slave system.
- **Module Extension Headers**—The complete pin sets of both the **MASTER** and **SLAVE** RabbitCore modules are duplicated at these two sets of headers. Developers can solder wires directly into the appropriate holes, or, for more flexible development, 26-pin header strips can be soldered into place. See Figure B-4 for the header pinouts.

- **RS-232**—Two 3-wire or one 5-wire RS-232 serial port are available on the Prototyping Board. Refer to the Prototyping Board schematic (090-0137) for additional details.

A 10-pin 0.1-inch spacing header strip is installed at J5 to permit connection of a ribbon cable leading to a standard DE-9 serial connector.

- **Current Measurement Option**—Jumpers across pins 1–2 and 5–6 on header JP1 can be removed and replaced with an ammeter across the pins to measure the current drawn from the +5 V or the +3.3 V supplies, respectively.
- **Motor Encoder**—A motor/encoder header is provided at header J6 for future use.
- **LCD/Keypad Module**—Rabbit's LCD/keypad module may be plugged in directly to headers J7, J8, and J10.

B.2 Mechanical Dimensions and Layout

Figure B-2 shows the mechanical dimensions and layout for the Prototyping Board.

Figure B-2. RCM30/31/32XX Prototyping Board Dimensions

NOTE: All measurements are in inches followed by millimeters enclosed in parentheses. All dimensions have a manufacturing tolerance of ± 0.01 " (0.25 mm).

Table B-1 lists the electrical, mechanical, and environmental specifications for the Prototyping Board.

Table B-1. Prototyping Board Specifications

Parameter	Specification
Board Size	5.30" × 6.775" × 1.00" (135 mm × 172 mm × 25 mm)
Operating Temperature	-20°C to +60°C
Humidity	5% to 95%, noncondensing
Input Voltage	8 V to 24 V DC
Maximum Current Draw (including user-added circuits)	800 mA max. for +3.3 V supply, 1 A total +3.3 V and +5 V combined
Prototyping Area	2.0" × 3.5" (50 mm × 90 mm) throughhole, 0.1" spacing, additional space for SMT components
Standoffs/Spacers	5, accept 4-40 × 3/8 screws

B.3 Power Supply

The RCM3209/RCM3229 requires a regulated 3.3 V ± 0.15 V DC power source to operate. Depending on the amount of current required by the application, different regulators can be used to supply this voltage.

The Prototyping Board has an onboard +5 V switching power regulator from which a +3.3 V linear regulator draws its supply. Thus both +5 V and +3.3 V are available on the Prototyping Board.

The Prototyping Board itself is protected against reverse polarity by a Shottky diode at D2 as shown in Figure B-3.

Figure B-3. Prototyping Board Power Supply

B.4 Using the Prototyping Board

The Prototyping Board is actually both a demonstration board and a prototyping board. As a demonstration board, it can be used to demonstrate the functionality of the RCM3209/RCM3229 right out of the box without any modifications to either board. There are no jumpers or dip switches to configure or misconfigure on the Prototyping Board so that the initial setup is very straightforward.

The Prototyping Board comes with the basic components necessary to demonstrate the operation of the RCM3209/RCM3229. Two LEDs (DS1 and DS2) are connected to PG6 and PG7, and two switches (S2 and S3) are connected to PG1 and PG0 to demonstrate the interface to the Rabbit 3000 microprocessor. Reset switch S1 is the hardware reset for the RCM3209/RCM3229.

The Prototyping Board provides the user with RCM3209/RCM3229 connection points brought out conveniently to labeled points at headers J2 and J4 on the Prototyping Board. Small to medium circuits can be prototyped using point-to-point wiring with 20 to 30 AWG wire between the prototyping area and the holes at locations J2 and J4. The holes are spaced at 0.1" (2.5 mm), and 40-pin headers or sockets may be installed at J2 and J4. The pinouts for locations J2 and J4, which correspond to headers J1 and J2, are shown in Figure B-4.

J2			J4

n.c. = not connected

**Figure B-4. Prototyping Board Pinout
(Top View)**

The small holes are also provided for surface-mounted components that may be installed around the prototyping area.

There is a 2.0" × 3.5" through-hole prototyping space available on the Prototyping Board. +3.3 V, +5 V, and GND traces run along the edge of the Prototyping Board for easy access.

B.4.1 Adding Other Components

There are pads that can be used for surface-mount prototyping involving SOIC devices. There is provision for seven 16-pin devices (six on one side, one on the other side). There are 10 sets of pads that can be used for 3- to 6-pin SOT23 packages. There are also pads that can be used for SMT resistors and capacitors in an 0805 SMT package. Each component has every one of its pin pads connected to a hole in which a 30 AWG wire can be soldered (standard wire wrap wire can be soldered in for point-to-point wiring on the Prototyping Board). Because the traces are very thin, carefully determine which set of holes is connected to which surface-mount pad.

B.4.2 Measuring Current Draw

The Prototyping Board has a current-measurement feature available on header JP1. Normally, a jumper connects pins 1–2 and pins 5–6 on header JP1, which provide jumper connections for the +5 V and the +3.3 V regulated voltages respectively. You may remove a jumper and place an ammeter across the pins instead, as shown in the example in Figure B-5, to measure the current being drawn.

Figure B-5. Prototyping Board Current-Measurement Option

B.4.3 Other Prototyping Board Modules and Options

With the RCM3209/RCM3229 plugged into the **MASTER** slots, it has full access to the RS-232 transceiver, and can act as the “master” relative to another RabbitCore RCM3000, RCM3100, or RCM3209/RCM3229 plugged into the **SLAVE** slots, which acts as the “slave.”

An optional LCD/keypad module is available that can be mounted on the Prototyping Board. Refer to Appendix C, “LCD/Keypad Module,” for complete information.

The RCM3209/RCM3229 has a 2-channel quadrature decoder and a 10-bit free-running PWM counter with four pulse-width registers. These features allow the RCM3209/RCM3229 to be used in a motor control application, although Rabbit does not offer the drivers or a compatible stepper motor control board at this time.

The Prototyping Board has a header at J6 to which a customer-developed motor encoder may be connected. Figure B-6 shows the motor encoder pinout at header J6.

Figure B-6. Prototyping Board Motor Encoder Connector Pinout

Refer to Appendix E, “Motor Control Option,” for complete information on using the Rabbit 3000’s Parallel Port F in conjunction with this application.

B.5 Use of Rabbit 3000 Parallel Ports

Table B-2 lists the Rabbit 3000 parallel ports and their use for the RCM30/31/32XX Prototyping Board.

**Table B-2. RCM30/31/32XX Prototyping Board
Use of Rabbit 3000 Parallel Ports**

Port	I/O	Use	Initial State	
PA0–PA7	Output	Configurable external I/O bus	High when not driven by I/O bus	
PB0–PB1	Input	Not used	Pulled up on RCM3209/ RCM3229	
PB2–PB5	Input	Configurable external I/O bus	High when not driven by I/O bus	
PB6–PB7	Output	Not used	Pulled up on RCM3209/ RCM3229	
PC0	Output	Not used	High (disabled)	
PC1	Input	Not used	Pulled up on RCM3209/ RCM3229	
PC2	Output	TXC	Serial Port C	High (disabled)
PC3	Input	RXC		Pulled up on RCM3209/ RCM3229
PC4	Output	TXB	Serial Port B	High (disabled)
PC5	Input	RXB		Pulled up on RCM3209/ RCM3229
PC6	Output	TXA Programming Port	Serial Port A	High (disabled)
PC7	Input	RXA Programming Port		Pulled up on RCM3209/ RCM3229
PD0	Output	Ethernet RSTDRV	High	
PD1	Input	Not used	Pulled up on RCM3209/ RCM3229	
PD2–PD4	Output	Not used	High	
PD5	Input	Not used	Pulled up on Prototyping Board	
PD6–PD7	Output	Not used	High	
PE0–PE1	Output	Not used	High	
PE2	Output	Ethernet chip select	High	
PE3	Output	LCD device select	Low (disabled)	
PE4	Output	IrDA speed select	Low (disabled)	

**Table B-2. RCM30/31/32XX Prototyping Board
Use of Rabbit 3000 Parallel Ports (continued)**

Port	I/O	Use		Initial State
PE5	Output	Not used		High
PE6	Output	External I/O strobe		High (disabled)
PE7	Output	Not used		High (disabled)
PF0–PF7	Input	Reserved for future use		Pulled up on Prototyping Board
PG0	Input	Switch S3 (normally open)		High
PG1	Input	Switch S2 (normally open)		High
PG2	Output	TXF IrDA	Serial Port F	Pulled down
PG3	Input	RXF IrDA		Driven by IrDA driver
PG4	Input	IrDA MD1		Pulled up on Prototyping Board
PG5	Input	IrDA MD0		Pulled down on Prototyping Board
PG6	Output	LED DS1		High (disabled)
PG7	Output	LED DS2		High (disabled)

APPENDIX C. LCD/KEYPAD MODULE

An optional LCD/keypad is available for the Prototyping Board. Appendix C describes the LCD/keypad and provides the software function calls to make full use of the LCD/keypad.

C.1 Specifications

Two optional LCD/keypad modules—with or without a panel-mounted bezel—are available for use with the Prototyping Board. They are shown in Figure C-1.

Figure C-1. LCD/Keypad Modules Models

Only the version without the bezel can mount directly on the Prototyping Board; if you have the version with a bezel, you will have to remove the bezel to be able to mount the LCD/keypad module on the Prototyping Board. Either version of the LCD/keypad module can be installed at a remote location up to 60 cm (24") away. Contact your Rabbit sales representative or your authorized distributor for further assistance in purchasing an LCD/keypad module.

Mounting hardware and a 60 cm (24") extension cable are also available for the LCD/keypad module through your sales representative or authorized distributor.

Table C-1 lists the electrical, mechanical, and environmental specifications for the LCD/keypad module.

Table C-1. LCD/Keypad Specifications

Parameter	Specification
Board Size	2.60" × 3.00" × 0.75" (66 mm × 76 mm × 19 mm)
Bezel Size	4.50" × 3.60" × 0.30" (114 mm × 91 mm × 7.6 mm)
Temperature	Operating Range: 0°C to +50°C Storage Range: -40°C to +85°C
Humidity	5% to 95%, noncondensing
Power Consumption	1.5 W maximum*
Connections	Connects to high-rise header sockets on the Prototyping Board
LCD Panel Size	122 × 32 graphic display
Keypad	7-key keypad
LEDs	Seven user-programmable LEDs

* The backlight adds approximately 650 mW to the power consumption.

The LCD/keypad module has 0.1" IDC headers at J1, J2, and J3 for physical connection to other boards or ribbon cables. Figure C-2 shows the LCD/keypad module footprint. These values are relative to one of the mounting holes.

NOTE: All measurements are in inches followed by millimeters enclosed in parentheses. All dimensions have a manufacturing tolerance of ±0.01" (0.25 mm).

Figure C-2. User Board Footprint for LCD/Keypad Module

C.2 Contrast Adjustments for All Boards

Starting in 2005, LCD/keypad modules were factory-configured to optimize their contrast based on the voltage of the system they would be used in. Be sure to select a KDU5V LCD/keypad module for use with the RCM3000/3100/3200 Prototyping Board — these modules operate at 5 V. You may adjust the contrast using the potentiometer at R2 as shown in Figure C-3. LCD/keypad modules configured for 3.3 V should not be used with the 5 V RCM3000/3100/3200 Prototyping Board because the higher voltage will reduce the backlight service life dramatically.

Figure C-3. LCD/Keypad Module Voltage Settings

You can set the contrast on the LCD display of pre-2005 LCD/keypad modules by adjusting the potentiometer at R2 or by setting the voltage for 5 V by removing the jumper across pins 1–2 on header J5 as shown in Figure C-3. Only one of these two options is available on these LCD/keypad modules.

NOTE: Older LCD/keypad modules that do not have a header at J5 or a contrast adjustment potentiometer at R2 are limited to operate only at 5 V, and will work with the Prototyping Board. The older LCD/keypad modules are no longer being sold.

C.3 Keypad Labeling

The keypad may be labeled according to your needs. A template is provided in Figure C-4 to allow you to design your own keypad label insert.

Figure C-4. Keypad Template

To replace the keypad legend, remove the old legend and insert your new legend prepared according to the template in Figure C-4. The keypad legend is located under the blue keypad matte, and is accessible from the left only as shown in Figure C-5.

Figure C-5. Removing and Inserting Keypad Label

C.4 Header Pinouts

Figure C-6 shows the pinouts for the LCD/keypad module.

Figure C-6. LCD/Keypad Module Pinouts

C.4.1 I/O Address Assignments

The LCD and keypad on the LCD/keypad module are addressed by the /CS strobe as explained in Table C-2.

Table C-2. LCD/Keypad Module Address Assignment

Address	Function
0xC000	Device select base address (/CS)
0xCxx0–0xCxx7	LCD control
0xCxx8	LED enable
0xCxx9	Not used
0xCxxA	7-key keypad
0xCxxB (bits 0–6)	7-LED driver
0xCxxB (bit 7)	LCD backlight on/off
0xCxxC–ExxF	Not used

C.5 Mounting LCD/Keypad Module on the Prototyping Board

Install the LCD/keypad module on header sockets J7, J8, and J10 of the Prototyping Board as shown in Figure C-7. Be careful to align the pins over the headers, and do not bend them as you press down to mate the LCD/keypad module with the Prototyping Board.

Figure C-7. Install LCD/Keypad Module on Prototyping Board

C.6 Bezel-Mount Installation

This section describes and illustrates how to bezel-mount the LCD/keypad module. Follow these steps for bezel-mount installation.

1. Cut mounting holes in the mounting panel in accordance with the recommended dimensions in Figure C-8, then use the bezel faceplate to mount the LCD/keypad module onto the panel.

Figure C-8. Recommended Cutout Dimensions

2. Carefully “drop in” the LCD/keypad module with the bezel and gasket attached.

3. Fasten the unit with the four 4-40 screws and washers included with the LCD/keypad module. If your panel is thick, use a 4-40 screw that is approximately 3/16" (5 mm) longer than the thickness of the panel.

Figure C-9. LCD/Keypad Module Mounted in Panel (rear view)

Carefully tighten the screws until the gasket is compressed and the plastic bezel faceplate is touching the panel.

Do not tighten each screw fully before moving on to the next screw. Apply only one or two turns to each screw in sequence until all are tightened manually as far as they can be so that the gasket is compressed and the plastic bezel faceplate is touching the panel.

C.6.1 Connect the LCD/Keypad Module to Your Prototyping Board

The LCD/keypad module can be located as far as 2 ft. (60 cm) away from the RCM30/31/32XX Prototyping Board, and is connected via a ribbon cable as shown in Figure C-10.

Figure C-10. Connecting LCD/Keypad Module to RCM30/31/32XX Prototyping Board

Note the locations and connections relative to pin 1 on both the Prototyping Board and the LCD/keypad module.

Rabbit offers 2 ft. (60 cm) extension cables. Contact your authorized Rabbit distributor or a sales representative for more information.

C.7 Sample Programs

Sample programs illustrating the use of the LCD/keypad module with the Prototyping Board are provided in the `SAMPLES\RCM3200` directory.

These sample programs use the external I/O bus on the Rabbit 3000 chip, and so the `#define PORTA_AUX_IO` line is already included in the sample programs.

Each sample program has comments that describe the purpose and function of the program. Follow the instructions at the beginning of the sample program. To run a sample program, open it with the **File** menu (if it is not still open), compile it using the **Compile** menu, and then run it by selecting **Run** in the **Run** menu. The RCM3209/RCM3229 must be in **Program** mode (see Section 4.3, “Serial Programming Cable”), and must be connected to a PC using the programming cable as described in Section 2.2.2.

Complete information on Dynamic C is provided in the *Dynamic C User's Manual*.

The following sample programs are found in the `SAMPLES\RCM3200\LCD_KEYPAD` folder.

- **KEYPADTOLED.C**—This program demonstrates the use of the external I/O bus. The program will light up an LED on the LCD/keypad module and will display a message on the LCD when a key press is detected. The DS1 and DS2 LEDs on the Prototyping Board will also light up.
- **LCDKEYFUN.C**—This program demonstrates how to draw primitive features from the graphic library (lines, circles, polygons), and also demonstrates the keypad with the key release option.
- **SWITCHTOLED.C**—This program demonstrates the use of the external I/O bus. The program will light up an LED on the LCD/keypad module and will display a message on the LCD when a switch press is detected. The DS1 and DS2 LEDs on the Prototyping Board will also light up.

C.8 LCD/Keypad Module Function Calls

When mounted on the Prototyping Board, the LCD/keypad module uses the external I/O bus on the Rabbit 3000 chip. Remember to add the line

```
#define PORTA_AUX_IO
```

to the beginning of any programs using the external I/O bus.

C.8.1 LCD/Keypad Module Initialization

The function used to initialize the LCD/keypad module can be found in the Dynamic C `LIB\DISPLAYS\LCD122KEY7.LIB` library.

`dispInit`

```
void dispInit();
```

DESCRIPTION

Initializes the LCD/keypad module. The keypad is set up using `keypadDef()` or `keyConfig()` after this function call.

RETURN VALUE

None.

C.8.2 LEDs

When power is applied to the LCD/keypad module for the first time, the red LED (DS1) will come on, indicating that power is being applied to the LCD/keypad module. The red LED is turned off when the `brdInit` function executes.

One function is available to control the LEDs, and can be found in the Dynamic C `LIB\DISPLAYS\LCD122KEY7.LIB` library.

`displedOut`

```
void dispLEDOut(int led, int value);
```

DESCRIPTION

LED on/off control. This function will only work when the LCD/keypad module is installed on the Prototyping Board.

PARAMETERS

<code>led</code>	is the LED to control. 0 = LED DS1 1 = LED DS2 2 = LED DS3 3 = LED DS4 4 = LED DS5 5 = LED DS6 6 = LED DS7
<code>value</code>	is the value used to control whether the LED is on or off (0 or 1). 0 = off 1 = on

RETURN VALUE

None.

C.8.3 LCD Display

The functions used to control the LCD display are contained in the Dynamic C `LIB\DISPLAYS\GRAPHIC\GRAPHIC.LIB` library. When x and y coordinates on the display screen are specified, x can range from 0 to 121, and y can range from 0 to 31. These numbers represent pixels from the top left corner of the display.

`glInit`

```
void glInit(void);
```

DESCRIPTION

Initializes the display devices, clears the screen.

RETURN VALUE

None.

SEE ALSO

`glDispOnOFF`, `glBacklight`, `glSetContrast`, `glPlotDot`, `glBlock`, `glPlotDot`, `glPlotPolygon`, `glPlotCircle`, `glHScroll`, `glVScroll`, `glXFontInit`, `glPrintf`, `glPutChar`, `glSetBrushType`, `glBuffLock`, `glBuffUnlock`, `glPlotLine`

`glBackLight`

```
void glBackLight(int onOff);
```

DESCRIPTION

Turns the display backlight on or off.

PARAMETER

<code>onOff</code>	turns the backlight on or off
	1—turn the backlight on
	0—turn the backlight off

RETURN VALUE

None.

SEE ALSO

`glInit`, `glDispOnoff`, `glSetContrast`

glDispOnOff

```
void glDispOnOff(int onOff);
```

DESCRIPTION

Sets the LCD screen on or off. Data will not be cleared from the screen.

PARAMETER

onOff	turns the LCD screen on or off
	1—turn the LCD screen on
	0—turn the LCD screen off

RETURN VALUE

None.

SEE ALSO

`glInit`, `glSetContrast`, `glBackLight`

glSetContrast

```
void glSetContrast(unsigned level);
```

DESCRIPTION

Sets display contrast.

NOTE: This function is not used with the LCD/keypad module since the support circuits are not available on the LCD/keypad module.

glFillScreen

```
void glFillScreen(int pattern);
```

DESCRIPTION

Fills the LCD display screen with a pattern.

PARAMETER

The screen will be set to all black if **pattern** is 0xFF, all white if **pattern** is 0x00, and vertical stripes for any other pattern.

RETURN VALUE

None.

SEE ALSO

`glBlock`, `glBlankScreen`, `glPlotPolygon`, `glPlotCircle`

glBlankScreen

```
void glBlankScreen(void);
```

DESCRIPTION

Blanks the LCD display screen (sets LCD display screen to white).

RETURN VALUE

None.

SEE ALSO

`glFillScreen`, `glBlock`, `glPlotPolygon`, `glPlotCircle`

glFillRegion

```
void glFillRegion(int left, int top, int width, int height,  
char pattern);
```

DESCRIPTION

Fills a rectangular block in the LCD buffer with the pattern specified. Any portion of the block that is outside the LCD display area will be clipped.

PARAMETERS

left	the x coordinate of the top left corner of the block.
top	the y coordinate of the top left corner of the block.
width	the width of the block.
height	the height of the block.
pattern	the bit pattern to display (all black if pattern is 0xFF, all white if pattern is 0x00, and vertical stripes for any other pattern).

RETURN VALUE

None.

SEE ALSO

`glFillScreen`, `glBlankScreen`, `glBlock`, `glBlankRegion`

glFastFillRegion

```
void glFastFillRegion(int left, int top, int width, int height,  
    char pattern);
```

DESCRIPTION

Fills a rectangular block in the LCD buffer with the pattern specified. The block left and width parameters must be byte-aligned. Any portion of the block that is outside the LCD display area will be clipped.

PARAMETERS

left	the x coordinate of the top left corner of the block.
top	the y coordinate of the top left corner of the block.
width	the width of the block.
height	the height of the block.
pattern	the bit pattern to display (all black if pattern is 0xFF, all white if pattern is 0x00, and vertical stripes for any other pattern).

RETURN VALUE

None.

SEE ALSO

`glFillScreen`, `glBlankScreen`, `glBlock`, `glBlankRegion`

glBlankRegion

```
void glBlankRegion(int left, int top, int width, int height);
```

DESCRIPTION

Clears a region on the LCD display. The block left and width parameters must be byte-aligned. Any portion of the block that is outside the LCD display area will be clipped.

PARAMETERS

left	the <i>x</i> coordinate of the top left corner of the block (<i>x</i> must be evenly divisible by 8).
top	the <i>y</i> coordinate of the top left corner of the block.
width	the width of the block (must be evenly divisible by 8).
height	the height of the block.

RETURN VALUE

None.

SEE ALSO

`glFillScreen`, `glBlankScreen`, `glBlock`

glBlock

```
void glBlock(int left, int top, int width, int height);
```

DESCRIPTION

Draws a rectangular block in the page buffer and on the LCD if the buffer is unlocked. Any portion of the block that is outside the LCD display area will be clipped.

PARAMETERS

left	the x coordinate of the top left corner of the block.
top	the y coordinate of the top left corner of the block.
width	the width of the block.
height	the height of the block.

RETURN VALUE

None.

SEE ALSO

`glFillScreen`, `glBlankScreen`, `glPlotPolygon`, `glPlotCircle`

glPlotVPolygon

```
void glPlotVPolygon(int n, int *pFirstCoord);
```

DESCRIPTION

Plots the outline of a polygon in the LCD page buffer, and on the LCD if the buffer is unlocked. Any portion of the polygon that is outside the LCD display area will be clipped. If fewer than 3 vertices are specified, the function will return without doing anything.

PARAMETERS

n	the number of vertices.
pFirstCoord	a pointer to array of vertex coordinates: x1,y1, x2,y2, x3,y3, ...

RETURN VALUE

None.

SEE ALSO

`glPlotPolygon`, `glFillPolygon`, `glFillVPolygon`

glPlotPolygon

```
void glPlotPolygon(int n, int y1, int x2, int y2, ...);
```

DESCRIPTION

Plots the outline of a polygon in the LCD page buffer and on the LCD if the buffer is unlocked. Any portion of the polygon that is outside the LCD display area will be clipped. If fewer than 3 vertices are specified, the function will return without doing anything.

PARAMETERS

n	the number of vertices.
y1	the y coordinate of the first vertex.
x1	the x coordinate of the first vertex.
y2	the y coordinate of the second vertex.
x2	the x coordinate of the second vertex.
...	the coordinates of additional vertices.

RETURN VALUE

None.

SEE ALSO

`glPlotVPolygon`, `glFillPolygon`, `glFillVPolygon`

glFillVPolygon

```
void glFillVPolygon(int n, int *pFirstCoord);
```

DESCRIPTION

Fills a polygon in the LCD page buffer and on the LCD screen if the buffer is unlocked. Any portion of the polygon that is outside the LCD display area will be clipped. If fewer than 3 vertices are specified, the function will return without doing anything.

PARAMETERS

n	the number of vertices.
pFirstCoord	a pointer to array of vertex coordinates: x1,y1, x2,y2, x3,y3, ...

RETURN VALUE

None.

SEE ALSO

`glFillPolygon`, `glPlotPolygon`, `glPlotVPolygon`

glFillPolygon

```
void glFillPolygon(int n, int x1, int y1, int x2, int y2, ...);
```

DESCRIPTION

Fills a polygon in the LCD page buffer and on the LCD if the buffer is unlocked. Any portion of the polygon that is outside the LCD display area will be clipped. If fewer than 3 vertices are specified, the function will return without doing anything.

PARAMETERS

n	the number of vertices.
x1	the x coordinate of the first vertex.
y1	the y coordinate of the first vertex.
x2	the x coordinate of the second vertex.
y2	the y coordinate of the second vertex.
...	the coordinates of additional vertices.

RETURN VALUE

None.

SEE ALSO

`glFillVPolygon`, `glPlotPolygon`, `glPlotVPolygon`

glPlotCircle

```
void glPlotCircle(int xc, int yc, int rad);
```

DESCRIPTION

Draws the outline of a circle in the LCD page buffer and on the LCD if the buffer is unlocked. Any portion of the circle that is outside the LCD display area will be clipped.

PARAMETERS

xc	the x coordinate of the center of the circle.
yc	the y coordinate of the center of the circle.
rad	the radius of the center of the circle (in pixels).

RETURN VALUE

None.

SEE ALSO

`glFillColor`, `glPlotPolygon`, `glFillPolygon`

glFillColor

```
void glFillColor(int xc, int yc, int rad);
```

DESCRIPTION

Draws a filled circle in the LCD page buffer and on the LCD if the buffer is unlocked. Any portion of the circle that is outside the LCD display area will be clipped.

PARAMETERS

xc	the x coordinate of the center of the circle.
yc	the y coordinate of the center of the circle.
rad	the radius of the center of the circle (in pixels).

RETURN VALUE

None.

SEE ALSO

`glPlotCircle`, `glPlotPolygon`, `glFillPolygon`

glXFontInit

```
void glXFontInit(fontInfo *pInfo, char pixWidth, char pixHeight,  
    unsigned startChar, unsigned endChar, unsigned long xmemBuffer);
```

DESCRIPTION

Initializes the font descriptor structure, where the font is stored in **xmem**. Each font character's bitmap is column major and byte aligned.

PARAMETERS

pInfo	a pointer to the font descriptor to be initialized.
pixWidth	the width (in pixels) of each font item.
pixHeight	the height (in pixels) of each font item.
startChar	the value of the first printable character in the font character set.
endChar	the value of the last printable character in the font character set.
xmemBuffer	the xmem pointer to a linear array of font bitmaps.

RETURN VALUE

None.

SEE ALSO

`glPrintf`

glFontCharAddr

```
unsigned long glFontCharAddr(fontInfo *pInfo, char letter);
```

DESCRIPTION

Returns the **xmem** address of the character from the specified font set.

PARAMETERS

pInfo pointer to the **xmem** address of the bitmap font set.
letter an ASCII character.

RETURN VALUE

xmem address of bitmap character font, column major and byte-aligned.

SEE ALSO

`glPutFont`, `glPrintf`

glPutFont

```
void glPutFont(int x, int y, fontInfo *pInfo, char code);
```

DESCRIPTION

Puts an entry from the font table to the page buffer and on the LCD if the buffer is unlocked. Each font character's bitmap is column major and byte-aligned. Any portion of the bitmap character that is outside the LCD display area will be clipped.

PARAMETERS

x the *x* coordinate (column) of the top left corner of the text.
y the *y* coordinate (row) of the top left corner of the text.
pInfo a pointer to the font descriptor.
code the ASCII character to display.

RETURN VALUE

None.

SEE ALSO

`glFontCharAddr`, `glPrintf`

glSetPfStep

```
void glSetPfStep(int stepX, int stepY);
```

DESCRIPTION

Sets the `glPrintf()` printing step direction. The *x* and *y* step directions are independent signed values. The actual step increments depend on the height and width of the font being displayed, which are multiplied by the step values.

PARAMETERS

<code>stepX</code>	the <code>glPrintf</code> <i>x</i> step value
<code>stepY</code>	the <code>glPrintf</code> <i>y</i> step value

RETURN VALUE

None.

SEE ALSO

Use `glGetPfStep()` to examine the current *x* and *y* printing step direction.

glGetPfStep

```
int glGetPfStep(void);
```

DESCRIPTION

Gets the current `glPrintf()` printing step direction. Each step direction is independent of the other, and is treated as an 8-bit signed value. The actual step increments depends on the height and width of the font being displayed, which are multiplied by the step values.

RETURN VALUE

The *x* step is returned in the MSB, and the *y* step is returned in the LSB of the integer result.

SEE ALSO

Use `glSetPfStep()` to control the *x* and *y* printing step direction.

glPutChar

```
void glPutChar(char ch, char *ptr, int *cnt, glPutCharInst
               *pInst)
```

DESCRIPTION

Provides an interface between the **STDIO** string-handling functions and the graphic library. The **STDIO** string-formatting function will call this function, one character at a time, until the entire formatted string has been parsed. Any portion of the bitmap character that is outside the LCD display area will be clipped.

PARAMETERS

ch	the character to be displayed on the LCD.
ptr	not used, but is a place holder for a pointer to STDIO string functions.
cnt	not used, is a place holder for a pointer to STDIO string functions.
pInst	a pointer to the font descriptor.

RETURN VALUE

None.

SEE ALSO

`glPrintf`, `glPutFont`, `doprnt`

glPrintf

```
void glPrintf(int x, int y, fontInfo *pInfo, char *fmt, ...);
```

DESCRIPTION

Prints a formatted string (much like `printf`) on the LCD screen. Only the character codes that exist in the font set are printed, all others are skipped. For example, `'\b'`, `'\t'`, `'\n'` and `'\r'` (ASCII backspace, tab, new line, and carriage return, respectively) will be printed if they exist in the font set, but will not have any effect as control characters. Any portion of the bitmap character that is outside the LCD display area will be clipped.

PARAMETERS

<code>x</code>	the <i>x</i> coordinate (column) of the upper left corner of the text.
<code>y</code>	the <i>y</i> coordinate (row) of the upper left corner of the text.
<code>pInfo</code>	a pointer to the font descriptor.
<code>fmt</code>	pointer to a formatted string.
<code>...</code>	formatted string conversion parameter(s).

EXAMPLE

```
glprintf(0,0, &fi12x16, "Test %d\n", count);
```

RETURN VALUE

None.

SEE ALSO

`glXFontInit`

glBuffLock

```
void glBuffLock(void);
```

DESCRIPTION

Increments LCD screen locking counter. Graphic calls are recorded in the LCD memory buffer and are not transferred to the LCD if the counter is non-zero.

NOTE: `glBuffLock()` and `glBuffUnlock()` can be nested up to a level of 255, but be sure to balance the calls. It is not a requirement to use these procedures, but a set of `glBuffLock()` and `glBuffUnlock()` bracketing a set of related graphic calls speeds up the rendering significantly.

RETURN VALUE

None.

SEE ALSO

`glBuffUnlock`, `glSwap`

glBuffUnlock

```
void glBuffUnlock(void);
```

DESCRIPTION

Decrements the LCD screen locking counter. The contents of the LCD buffer are transferred to the LCD if the counter goes to zero.

RETURN VALUE

None.

SEE ALSO

`glBuffLock`, `glSwap`

glSwap

```
void glSwap(void);
```

DESCRIPTION

Checks the LCD screen locking counter. The contents of the LCD buffer are transferred to the LCD if the counter is zero.

RETURN VALUE

None.

SEE ALSO

glBuffUnlock, **glBuffLock**, **_glSwapData** (located in the library specifically for the LCD that you are using)

glSetBrushType

```
void glSetBrushType(int type);
```

DESCRIPTION

Sets the drawing method (or color) of pixels drawn by subsequent graphic calls.

PARAMETER

type value can be one of the following macros.

- PIXBLACK** draws black pixels (turns pixel on).
- PIXWHITE** draws white pixels (turns pixel off).
- PIXXOR** draws old pixel XOR'ed with the new pixel.

RETURN VALUE

None.

SEE ALSO

glGetBrushType

glGetBrushType

```
int glGetBrushType(void);
```

DESCRIPTION

Gets the current method (or color) of pixels drawn by subsequent graphic calls.

RETURN VALUE

The current brush type.

SEE ALSO

`glSetBrushType`

glXGetBitmap

```
void glXGetBitmap(int x, int y, int bmWidth, int bmHeight,  
unsigned long xBm);
```

DESCRIPTION

Gets a bitmap from the LCD page buffer and stores it in **xmem** RAM. This function automatically calls `glXGetFastmap()` if the left edge of the bitmap is byte-aligned and the left edge and width are each evenly divisible by 8.

This function call is intended for use only when a graphic engine is used to interface with the LCD/keypad module.

PARAMETERS

x	the <i>x</i> coordinate in pixels of the top left corner of the bitmap (<i>x</i> must be evenly divisible by 8).
y	the <i>y</i> coordinate in pixels of the top left corner of the bitmap.
bmWidth	the width in pixels of the bitmap (must be evenly divisible by 8).
bmHeight	the height in pixels of the bitmap.
xBm	the xmem RAM storage address of the bitmap.

RETURN VALUE

None.

glXGetFastmap

```
void glXGetFastmap(int left, int top, int width, int height,  
    unsigned long xmemptr);
```

DESCRIPTION

Draws bitmap in the specified space. The data for the bitmap are stored in **xmem**. This function is similar to **glXPutBitmap()**, except that it's faster. The bitmap must be byte-aligned. Any portion of a bitmap image or character that is outside the LCD display area will be clipped.

This function call is intended for use only when a graphic engine is used to interface with the LCD/keypad module.

PARAMETERS

left	the x coordinate of the top left corner of the bitmap (x must be evenly divisible by 8).
top	the y coordinate in pixels of the top left corner of the bitmap.
width	the width of the bitmap (must be evenly divisible by 8).
height	the height of the bitmap.
xmemptr	the xmem RAM storage address of the bitmap.

RETURN VALUE

None.

SEE ALSO

glXPutBitmap, **glPrintf**

glPlotDot

```
void glPlotDot(int x, int y);
```

DESCRIPTION

Draws a single pixel in the LCD buffer, and on the LCD if the buffer is unlocked. If the coordinates are outside the LCD display area, the dot will not be plotted.

PARAMETERS

x	the x coordinate of the dot.
y	the y coordinate of the dot.

RETURN VALUE

None.

SEE ALSO

`glPlotline`, `glPlotPolygon`, `glPlotCircle`

glPlotLine

```
void glPlotLine(int x0, int y0, int x1, int y1);
```

DESCRIPTION

Draws a line in the LCD buffer, and on the LCD if the buffer is unlocked. Any portion of the line that is beyond the LCD display area will be clipped.

PARAMETERS

x0	the x coordinate of one endpoint of the line.
y0	the y coordinate of one endpoint of the line.
x1	the x coordinate of the other endpoint of the line.
y1	the y coordinate of the other endpoint of the line.

RETURN VALUE

None.

SEE ALSO

`glPlotDot`, `glPlotPolygon`, `glPlotCircle`

glLeft1

```
void glLeft1(int left, int top, int cols, int rows);
```

DESCRIPTION

Scrolls byte-aligned window left one pixel, right column is filled by current pixel type (color).

PARAMETERS

left	the top left corner of bitmap, must be evenly divisible by 8, otherwise truncates.
top	the top left corner of the bitmap.
cols	the number of columns in the window, must be evenly divisible by 8, otherwise truncates.
rows	the number of rows in the window.

RETURN VALUE

None.

SEE ALSO

`glHScroll`, `glRight1`

glRight1

```
void glRight1(int left, int top, int cols, int rows);
```

DESCRIPTION

Scrolls byte-aligned window right one pixel, left column is filled by current pixel type (color).

PARAMETERS

left	the top left corner of bitmap, must be evenly divisible by 8, otherwise truncates.
top	the top left corner of the bitmap.
cols	the number of columns in the window, must be evenly divisible by 8, otherwise truncates.
rows	the number of rows in the window.

RETURN VALUE

None.

SEE ALSO

`glHScroll`, `glLeft1`

glUp1

```
void glUp1(int left, int top, int cols, int rows);
```

DESCRIPTION

Scrolls byte-aligned window up one pixel, bottom column is filled by current pixel type (color).

PARAMETERS

left	the top left corner of bitmap, must be evenly divisible by 8, otherwise truncates.
top	the top left corner of the bitmap.
cols	the number of columns in the window, must be evenly divisible by 8, otherwise truncates.
rows	the number of rows in the window.

RETURN VALUE

None.

SEE ALSO

`glVScroll`, `glDown1`

glDown1

```
void glDown1(int left, int top, int cols, int rows);
```

DESCRIPTION

Scrolls byte-aligned window down one pixel, top column is filled by current pixel type (color).

PARAMETERS

left	the top left corner of bitmap, must be evenly divisible by 8, otherwise truncates.
top	the top left corner of the bitmap.
cols	the number of columns in the window, must be evenly divisible by 8, otherwise truncates.
rows	the number of rows in the window.

RETURN VALUE

None.

SEE ALSO

`glVScroll`, `glUp1`

glHScroll

```
void glHScroll(int left, int top, int cols, int rows, int nPix);
```

DESCRIPTION

Scrolls right or left, within the defined window by x number of pixels. The opposite edge of the scrolled window will be filled in with white pixels. The window must be byte-aligned.

Parameters will be verified for the following:

1. The **left** and **cols** parameters will be verified that they are evenly divisible by 8. If not, they will be truncated to a value that is a multiple of 8.
2. Parameters will be checked to verify that the scrolling area is valid. The minimum scrolling area is a width of 8 pixels and a height of one row.

PARAMETERS

left	the top left corner of bitmap, must be evenly divisible by 8.
top	the top left corner of the bitmap.
cols	the number of columns in the window, must be evenly divisible by 8.
rows	the number of rows in the window.
nPix	the number of pixels to scroll within the defined window (a negative value will produce a scroll to the left).

RETURN VALUE

None.

SEE ALSO

`glVScroll`

glVScroll

```
void glVScroll(int left, int top, int cols, int rows, int nPix);
```

DESCRIPTION

Scrolls up or down, within the defined window by x number of pixels. The opposite edge of the scrolled window will be filled in with white pixels. The window must be byte-aligned.

Parameters will be verified for the following:

1. The **left** and **cols** parameters will be verified that they are evenly divisible by 8. If not, they will be truncated to a value that is a multiple of 8.
2. Parameters will be checked to verify that the scrolling area is valid. The minimum scrolling area is a width of 8 pixels and a height of one row.

PARAMETERS

left	the top left corner of bitmap, must be evenly divisible by 8.
top	the top left corner of the bitmap.
cols	the number of columns in the window, must be evenly divisible by 8.
rows	the number of rows in the window.
nPix	the number of pixels to scroll within the defined window (a negative value will produce a scroll up).

RETURN VALUE

None.

SEE ALSO

`glHScroll`

glXPutBitmap

```
void glXPutBitmap(int left, int top, int width, int height,  
    unsigned long bitmap);
```

DESCRIPTION

Draws bitmap in the specified space. The data for the bitmap are stored in **xmem**. This function calls **glXPutFastmap()** automatically if the bitmap is byte-aligned (the left edge and the width are each evenly divisible by 8).

Any portion of a bitmap image or character that is outside the LCD display area will be clipped.

PARAMETERS

left	the top left corner of the bitmap.
top	the top left corner of the bitmap.
width	the width of the bitmap.
height	the height of the bitmap.
bitmap	the address of the bitmap in xmem .

RETURN VALUE

None.

SEE ALSO

glXPutFastmap, **glPrintf**

glXPutFastmap

```
void glXPutFastmap(int left, int top, int width, int height,  
    unsigned long bitmap);
```

DESCRIPTION

Draws bitmap in the specified space. The data for the bitmap are stored in **xmem**. This function is like **glXPutBitmap()**, except that it is faster. The restriction is that the bitmap must be byte-aligned.

Any portion of a bitmap image or character that is outside the LCD display area will be clipped.

PARAMETERS

left	the top left corner of the bitmap, must be evenly divisible by 8, otherwise truncates.
top	the top left corner of the bitmap.
width	the width of the bitmap, must be evenly divisible by 8, otherwise truncates.
height	the height of the bitmap.
bitmap	the address of the bitmap in xmem .

RETURN VALUE

None.

SEE ALSO

glXPutBitmap, **glPrintf**

TextWindowFrame

```
int TextWindowFrame(windowFrame *window, fontInfo *pFont, int x,  
    int y, int winWidth, int winHeight);
```

DESCRIPTION

Defines a text-only display window. This function provides a way to display characters within the text window using only character row and column coordinates. The text window feature provides end-of-line wrapping and clipping after the character in the last column and row is displayed.

NOTE: Execute the `TextWindowFrame()` function before other `Text...` functions.

PARAMETERS

window	a pointer to the window frame descriptor.
pFont	a pointer to the font descriptor.
x	the <i>x</i> coordinate of the top left corner of the text window frame.
y	the <i>y</i> coordinate of the top left corner of the text window frame.
winWidth	the width of the text window frame.
winHeight	the height of the text window frame.

RETURN VALUE

- 0—window frame was successfully created.
- 1—*x* coordinate + width has exceeded the display boundary.
- 2—*y* coordinate + height has exceeded the display boundary.
- 3—Invalid **winHeight** and/or **winWidth** parameter value.

TextBorderInit

```
void TextBorderInit(windowFrame *wPtr, int border, char *title);
```

DESCRIPTION

This function initializes the window frame structure with the border and title information.

NOTE: Execute the `TextWindowFrame()` function before using this function.

PARAMETERS

wPtr	a pointer to the window frame descriptor.
border	the border style: SINGLE_LINE —The function will draw a single-line border around the text window. DOUBLE_LINE —The function will draw a double-line border around the text window.
title	a pointer to the title information: If a NULL string is detected, then no title is written to the text menu. If a string is detected, then it will be written center-aligned to the top of the text menu box.

RETURN VALUE

None.

SEE ALSO

`TextBorder`, `TextGotoXY`, `TextPutChar`, `TextWindowFrame`, `TextCursorLocation`

TextBorder

```
void TextBorder(windowFrame *wPtr);
```

DESCRIPTION

This function displays the border for a given window frame. This function will automatically adjust the text window parameters to accommodate the space taken by the text border. This adjustment will only occur once after the `TextBorderInit()` function executes.

NOTE: Execute the `TextWindowFrame()` function before using this function.

PARAMETER

`wPtr` a pointer to the window frame descriptor.

RETURN VALUE

None.

SEE ALSO

`TextBorderInit`, `TextGotoXY`, `TextPutChar`, `TextWindowFrame`,
`TextCursorPosition`

TextGotoXY

```
void TextGotoXY(windowFrame *window, int col, int row);
```

DESCRIPTION

Sets the cursor location to display the next character. The display location is based on the height and width of the character to be displayed.

NOTE: Execute the `TextWindowFrame()` function before using this function.

PARAMETERS

`window` a pointer to a font descriptor.

`col` a character column location.

`row` a character row location.

RETURN VALUE

None.

SEE ALSO

`TextPutChar`, `TextPrintf`, `TextWindowFrame`

TextCursorLocation

```
void TextCursorLocation(windowFrame *window, int *col, int *row);
```

DESCRIPTION

Gets the current cursor location that was set by a graphic **Text...** function.

NOTE: Execute the **TextWindowFrame()** function before using this function.

PARAMETERS

window	a pointer to a font descriptor.
col	a pointer to cursor column variable.
row	a pointer to cursor row variable.

RETURN VALUE

Lower word = Cursor Row location
Upper word = Cursor Column location

SEE ALSO

TextGotoXY, **TextPrintf**, **TextWindowFrame**, **TextCursorLocation**

TextPutChar

```
void TextPutChar(struct windowFrame *window, char ch);
```

DESCRIPTION

Displays a character on the display where the cursor is currently pointing. Once a character is displayed, the cursor will be incremented to the next character position. If any portion of a bitmap character is outside the LCD display area, the character will not be displayed.

NOTE: Execute the `TextWindowFrame()` function before using this function.

PARAMETERS

<code>window</code>	a pointer to a font descriptor.
<code>ch</code>	a character to be displayed on the LCD.

RETURN VALUE

None.

SEE ALSO

`TextGotoXY`, `TextPrintf`, `TextWindowFrame`, `TextCursorPosition`

TextPrintf

```
void TextPrintf(struct windowFrame *window, char *fmt, ...);
```

DESCRIPTION

Prints a formatted string (much like `printf`) on the LCD screen. Only printable characters in the font set are printed; escape sequences `\r` and `\n` are also recognized. All other escape sequences will be skipped over; for example, `\b` and `\t` will cause nothing to be displayed.

The text window feature provides end-of-line wrapping and clipping after the character in the last column and row is displayed. The cursor then remains at the end of the string.

NOTE: Execute the `TextWindowFrame()` function before using this function.

PARAMETERS

<code>window</code>	a pointer to a font descriptor.
<code>fmt</code>	a pointer to a formatted string.
<code>...</code>	formatted string conversion parameter(s).

EXAMPLE

```
TextPrintf(&TextWindow, "Test %d\n", count);
```

RETURN VALUE

None.

SEE ALSO

`TextGotoXY`, `TextPutChar`, `TextWindowFrame`, `TextCursorPosition`

TextMaxChars

```
int TextMaxChars(windowFrame *wPtr);
```

DESCRIPTION

This function returns the maximum number of characters that can be displayed within the text window.

NOTE: Execute the `TextWindowFrame()` function before using this function.

PARAMETER

wPtr a pointer to the window frame descriptor.

RETURN VALUE

The maximum number of characters that can be displayed within the text window.

SEE ALSO

`TextGotoXY`, `TextPrintf`, `TextWindowFrame`, `TextCursorPosition`

TextWinClear

```
void TextWinClear(windowFrame *wPtr);
```

DESCRIPTION

This function clears the entire area within the specified text window.

NOTE: Execute the `TextWindowFrame()` function before using this function.

PARAMETERS

wPtr a pointer to the window frame descriptor.

RETURN VALUE

None.

SEE ALSO

`TextGotoXY`, `TextPrintf`, `TextWindowFrame`, `TextCursorPosition`

C.8.4 Keypad

The functions used to control the keypad are contained in the Dynamic C `LIB\KEYPADS\KEYPAD7.LIB` library.

`keyInit`

```
void keyInit(void);
```

DESCRIPTION

Initializes keypad process.

RETURN VALUE

None.

SEE ALSO

`brdInit`

keyConfig

```
void keyConfig(char cRaw, char cPress, char cRelease,  
               char cCntHold, char cSpdLo, char cCntLo, char cSpdHi);
```

DESCRIPTION

Assigns each key with keypress and release codes, and hold and repeat ticks for auto repeat and debouncing.

PARAMETERS

cRaw a raw key code index.

1 × 7 keypad matrix with raw key code index assignments (in brackets):

[0]	[1]	[2]	[3]
[4]	[5]	[6]	

User Keypad Interface

cPress a keypress code

An 8-bit value is returned when a key is pressed.

0 = Unused.

See **keypadDef ()** for default press codes.

cRelease a key release code.

An 8-bit value is returned when a key is pressed.

0 = Unused.

cCntHold a hold tick, which is approximately one debounce period or 5 μs.

How long to hold before repeating.

0 = No Repeat.

cSpdLo a low-speed repeat tick, which is approximately one debounce period or 5 μs.

How many times to repeat.

0 = None.

cCntLo a low-speed hold tick, which is approximately one debounce period or 5 μs.

How long to hold before going to high-speed repeat.

0 = Slow Only.

cSpdHi a high-speed repeat tick, which is approximately one debounce period or 5 μs.

How many times to repeat after low speed repeat.

0 = None.

keyConfig (continued)

RETURN VALUE

None.

SEE ALSO

`keyProcess`, `keyGet`, `keypadDef`

keyProcess

```
void keyProcess(void);
```

DESCRIPTION

Scans and processes keypad data for key assignment, debouncing, press and release, and repeat.

NOTE: This function is also able to process an 8×8 matrix keypad.

RETURN VALUE

None.

SEE ALSO

`keyConfig`, `keyGet`, `keypadDef`

keyGet

```
char keyGet(void);
```

DESCRIPTION

Get next keypress.

RETURN VALUE

The next keypress, or 0 if none.

SEE ALSO

`keyConfig`, `keyProcess`, `keypadDef`

keyUnget

```
int keyUnget(char cKey);
```

DESCRIPTION

Pushes the value of **cKey** to the top of the input queue, which is 16 bytes deep.

PARAMETER

cKey

RETURN VALUE

None.

SEE ALSO

[keyGet](#)

keypadDef

```
void keypadDef();
```

DESCRIPTION

Configures the physical layout of the keypad with the desired ASCII return key codes.

1 × 7 keypad physical mapping:

0	4	1	5	2	6	3
['L']		['U']		['D']		['R']
	['-']		['+']		['E']	

where

- 'L' represents Left Scroll
- 'U' represents Up Scroll
- 'D' represents Down Scroll
- 'R' represents Right Scroll
- '-' represents Page Down
- '+' represents Page Up
- 'E' represents the ENTER key

Example: Do the following for the above physical vs. ASCII return key codes.

```
keyConfig ( 3, 'R', 0, 0, 0, 0, 0 );  
keyConfig ( 6, 'E', 0, 0, 0, 0, 0 );  
keyConfig ( 2, 'D', 0, 0, 0, 0, 0 );  
keyConfig ( 4, '-', 0, 0, 0, 0, 0 );  
keyConfig ( 1, 'U', 0, 0, 0, 0, 0 );  
keyConfig ( 5, '+', 0, 0, 0, 0, 0 );  
keyConfig ( 0, 'L', 0, 0, 0, 0, 0 );
```

Characters are returned upon keypress with no repeat.

RETURN VALUE

None.

SEE ALSO

`keyConfig`, `keyGet`, `keyProcess`

keyScan

```
void keyScan(char *pcKeys);
```

DESCRIPTION

Writes "1" to each row and reads the value. The position of a keypress is indicated by a zero value in a bit position.

PARAMETER

pcKeys a pointer to the address of the value read.

RETURN VALUE

None.

SEE ALSO

`keyConfig`, `keyGet`, `keypadDef`, `keyProcess`

APPENDIX D. POWER SUPPLY

Appendix D provides information on the current requirements of the RCM3209/RCM3229, and includes some background on the chip select circuit used in power management.

D.1 Power Supplies

The RCM3209/RCM3229 requires a regulated $3.3\text{ V} \pm 0.15\text{ V}$ DC power source. The RabbitCore design presumes that the voltage regulator is on the user board, and that the power is made available to the RCM3209/RCM3229 board through header J62.

An RCM3209/RCM3229 with no loading at the outputs operating at 29.4 MHz typically draws 145 mA. The RCM3209/RCM3229 will consume an additional 10 mA when the programming cable is used to connect the programming header, J1, to a PC.

D.1.1 Battery Backup

The RCM3209/RCM3229 does not have a battery, but there is provision for a customer-supplied battery to back up the data SRAM and keep the internal Rabbit 3000 real-time clock running.

Header J62, shown in Figure D-1, allows access to the external battery. This header makes it possible to connect an external 3 V power supply. This allows the SRAM and the internal Rabbit 3000 real-time clock to retain data with the RCM3209/RCM3229 powered down.

Figure D-1. External Battery Connections at Header J2

A lithium battery with a nominal voltage of 3 V and a minimum capacity of 165 mA·h is recommended. A lithium battery is strongly recommended because of its nearly constant nominal voltage over most of its life.

The drain on the battery by the RCM3209/RCM3229 is typically 12 μ A when no other power is supplied. If a 165 mA·h battery is used, the battery can last almost 2 years:

$$\frac{165 \text{ mA}\cdot\text{h}}{12 \text{ }\mu\text{A}} = 1.6 \text{ years.}$$

The actual life in your application will depend on the current drawn by components, not on the RCM3209/RCM3229 and the storage capacity of the battery. The RCM3209/RCM3229 does not drain the battery while it is powered up normally.

Cycle the main power off/on on the RCM3209/RCM3229 after you install a backup battery for the first time, and whenever you replace the battery. This step will minimize the current drawn by the real-time clock oscillator circuit from the backup battery should the RCM3209/RCM3229 experience a loss of main power.

NOTE: Remember to cycle the main power off/on any time the RCM3209/RCM3229 is removed from the Prototyping Board or motherboard since that is where the backup battery would be located.

Rabbit's Technical Note TN235, *External 32.768 kHz Oscillator Circuits*, provides additional information about the current draw by the real-time clock oscillator circuit.

D.1.2 Battery-Backup Circuit

Figure D-2 shows the battery-backup circuit.

Figure D-2. RCM3209/RCM3229 Backup Battery Circuit

The battery-backup circuit serves three purposes:

- It reduces the battery voltage to the SRAM and to the real-time clock, thereby limiting the current consumed by the real-time clock and lengthening the battery life.
- It ensures that current can flow only *out* of the battery to prevent charging the battery.
- A voltage, VOSC, is supplied to U5, which keeps the 32.768 kHz oscillator working when the voltage begins to drop.

D.1.3 Reset Generator

The RCM3209/RCM3229 uses a reset generator to reset the Rabbit 3000 microprocessor when the voltage drops below the voltage necessary for reliable operation. The reset occurs between 2.85 V and 3.00 V, typically 2.93 V. The RCM3209/RCM3229 has a reset output, pin 1 on header J2.

D.2 Optional +5 V Output

The RCM3209/RCM3229 boards have an onboard charge pump that provides the +5 V needed by the RealTek Ethernet chip.

APPENDIX E. MOTOR CONTROL OPTION

The Prototyping Board has a header at J6 for a motor control option. While Rabbit does not support this option at this time, this appendix provides additional information about Parallel Port F on the Rabbit 3000 microprocessor to enable you to use this feature on the Prototyping Board for your needs.

E.1 Overview

The Parallel Port F connector on the Prototyping Board, J6, gives access to all 8 pins of Parallel Port F, along with +5 V. This appendix describes the function of each pin, and the ways they may be used for motion-control applications. It should be read in conjunction with the *Rabbit 3000 Microprocessor User's Manual* and the RCM3209 and the Prototyping Board schematics.

E.2 Header J6

The connector is a 2×5 , 0.1" pitch header suitable for connecting to an IDC header socket, with the following pin allocations.

Table E-1. Prototyping Board Header J6 Pinout

Pin	Rabbit 3000	Primary Function	Alternate Function 1	Alternate Function 2
1	Parallel Port F, bit 0	General-purpose I/O port	Quadrature decoder 1 Q input	SCLK_D
2	Parallel Port F, bit 1	General-purpose I/O port	Quadrature decoder 1 I input	SCLK_C
3	Parallel Port F, bit 2	General-purpose I/O port	Quadrature decoder 2 Q input	-
4	Parallel Port F, bit 3	General-purpose I/O port	Quadrature decoder 2 I input	-
5	Parallel Port F, bit 4	General-purpose I/O port	PWM[0] output	Quadrature decoder 1 Q input
6	Parallel Port F, bit 5	General-purpose I/O port	PWM[1] output	Quadrature decoder 1 I input
7	Parallel Port F, bit 6	General-purpose I/O port	PWM[2] output	Quadrature decoder 2 Q input
8	Parallel Port F, bit 7	General-purpose I/O port	PWM[3] output	Quadrature decoder 2 I input
9	+5 V	External buffer logic supply		
10	0 V	Common		

All Parallel Port F lines (pins 1 to 8) are pulled up internally to +3.3 V via 100 k Ω resistors. When used as outputs, the port pins will sink up to 6 mA at a V_{OL} of 0.4 V max. (0.2 V typ), and source up to 6 mA at a V_{OH} of 2.2 V typ. When used as inputs, all pins are 5 V tolerant.

As the outputs from Parallel Port F are compatible with 3.3 V logic, buffers may be needed when the external circuit drive requirements exceed the 2.2 V typ logic high and/or the 6 mA maximum from the Rabbit 3000. The +5 V supply output is provided for supplying interface logic. When used as inputs, the pins on header J6 do not require buffers unless the input voltage will exceed the 5 V tolerance of the processor pins. Usually, a simple resistive divider with catching diodes will suffice if higher voltage inputs are required. If the outputs are configured for open-drain operation, they may be pulled up to +5 V (while observing the maximum current, of course).

E.3 Using Parallel Port F

Parallel Port F is a byte-wide port with each bit programmable for data direction and drive. These are simple inputs and outputs controlled and reported in the Port F Data Register. As outputs, the bits of the port are buffered, with the data written to the Port F Data Register transferred to the output pins on a selected timing edge. The outputs of Timer A1, Timer B1, or Timer B2 can be used for this function, with each nibble of the port having a separate select field to control this timing. These inputs and outputs are also used for access to other peripherals on the chip.

As outputs, Parallel Port F can carry the four Pulse Width Modulator outputs on PF4–PF 7 (J6, pins 5–8). As inputs, Parallel Port F can carry the inputs to the Quadrature Decoders on PF0–PF3 (J6, pins 1–4). When Serial Port C or Serial Port D is used in clocked serial mode, two pins of Port F (PF0 / J6:1 and PF1 / J6:2) are used to carry the serial clock signals. When the internal clock is selected in these serial ports, the corresponding bit of Parallel Port F is set as an output.

E.3.1 Parallel Port F Registers

Data Direction Register—**PFDDR**, address 00111111 (0x3F), write-only, default value on reset 00000000. For each bit position, write a 1 to make the corresponding port line an output, or 0 to produce an input.

Drive Control Register—**PFDCR**, address 00111110 (0x3E), Write-only, no default on reset (port defaults to all inputs). Effective only if the corresponding port bits are set as outputs, each bit set to 1 configures the corresponding port bit as open drain. Setting the bit to 0 configures that output as active high or low.

Function Register—**PFFR**, address 00111101 (0x3D), Write-only, no default on reset. This register sets the alternate output function assigned to each of the pins of the port. When set to 0, the corresponding port pin functions normally as an output (if configured to be an output in **PFDDR**). When set to 1, each bit sets the corresponding pin to have the alternate output function as shown in the summary table at the end of this section.

Control Register—**PFCCR**, address 00111100 (0x3C), Write-only, default on reset xx00xx00. This register sets the transfer clock, which controls the timing of the outputs on each nibble of the output ports to allow close synchronization with other events. The summary table at the end of this section shows the settings for this register. The default values on reset transfer the output values on **CLK/2**.

Data Register—**PFDR**, address 00111000 (0x38), Read or Write, no default value on reset. On read, the current state of the pins is reported. On write, the output buffer is written with the value for transfer to the output port register on the next rising edge of the transfer clock, set in the **PFCCR**.

Table E-2. Parallel Port F Registers

Register Name	Mnemonic	I/O Address	R/W	Reset Value
Port F Data Register	PFDR	00111000 (0x38)	R/W	xxxxxxx
Bits	Value	Description		
0:7	Read	Current state of pins		
	Write	Port buffer. Value transferred to O/P register on next rising edge of transfer clock.		
Port F Control Register	PFCR	00111100 (0x3C)	W only	xx00xx00
Bits	Value	Description		
0:1	00	Lower nibble transfer clock is CLK/2		
	01	Lower nibble transfer clock is Timer A1		
	10	Lower nibble transfer clock is Timer B1		
	11	Lower nibble transfer clock is Timer B2		
2:3	xx	These bits are ignored		
4:5	00	Upper nibble transfer clock is CLK/2		
	01	Upper nibble transfer clock is Timer A1		
	10	Upper nibble transfer clock is Timer B1		
	11	Upper nibble transfer clock is Timer B2		
6:7	xx	These bits are ignored		
Port F Function Register	PFFR	00111101 (0x3D)	W	xxxxxxx
Bits	Value	Description		
0:7	0	Corresponding port bits function normally		
0	1	Bit 0 carries SCLK_D		
1	1	Bit 1 carries SCLK_C		
2:3	x	No effect		
4	1	Bit 4 carries PWM[0] output		
5	1	Bit 5 carries PWM[1] output		
6	1	Bit 6 carries PWM[2] output		
7	1	Bit 7 carries PWM[3] output		
Port F Drive Control Register	PFDCR	00111110 (0x3E)	W	xxxxxxx
Bits	Value	Description		
0:7	0	Corresponding port bit is active high or low		
	1	Corresponding port bit is open drain		

Table E-2. Parallel Port F Registers (continued)

Register Name	Mnemonic	I/O Address	R/W	Reset Value
Port F Data Direction Register	PFDDR	00111111 (0x3F)	W	00000000
Bits	Value	Description		
0:7	0	Corresponding port bit is an input		
	1	Corresponding port bit is an output		

E.4 PWM Outputs

The Pulse-Width Modulator consists of a 10-bit free-running counter and four width registers. Each PWM output is high for $n + 1$ counts out of the 1024-clock count cycle, where n is the value held in the width register. The PWM output high time can optionally be spread throughout the cycle to reduce ripple on the externally filtered PWM output. The PWM is clocked by the output of Timer A9. The spreading function is implemented by dividing each 1024-clock cycle into four quadrants of 256 clocks each. Within each quadrant, the Pulse-Width Modulator uses the eight MSBs of each pulse-width register to select the base width in each of the quadrants. This is the equivalent to dividing the contents of the pulse-width register by four and using this value in each quadrant. To get the exact high time, the Pulse-Width Modulator uses the two LSBs of the pulse-width register to modify the high time in each quadrant according to Table E-3 below. The “ $n/4$ ” term is the base count, and is formed from the eight MSBs of the pulse-width register.

Table E-3. PWM Outputs

Pulse Width LSBs	1st	2nd	3rd	4th
00	$n/4 + 1$	$n/4$	$n/4$	$n/4$
01	$n/4 + 1$	$n/4$	$n/4 + 1$	$n/4$
10	$n/4 + 1$	$n/4 + 1$	$n/4 + 1$	$n/4$
11	$n/4 + 1$	$n/4 + 1$	$n/4 + 1$	$n/4 + 1$

The diagram below shows a PWM output for several different width values for both modes of operation. Operation in the spread mode reduces the filtering requirements on the PWM output in most cases.

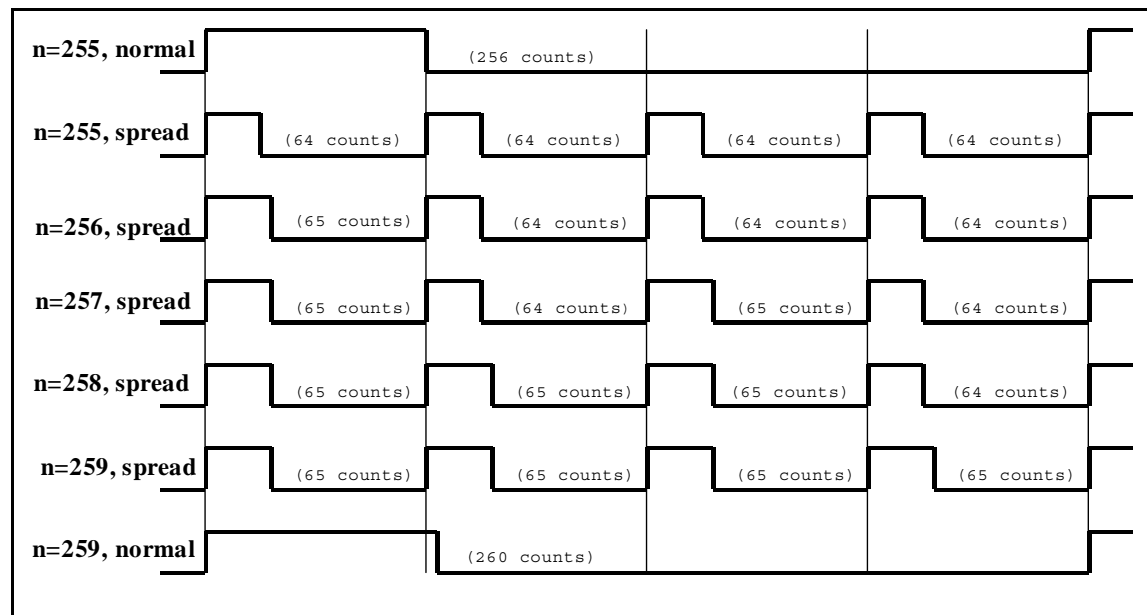

Figure E-1. PWM Outputs for Various Normal and Spread Modes

E.5 PWM Registers

There are no default values on reset for any of the PWM registers.

Table E-4. PWM Registers

PWM LSBs	Register	Address
	PWL0R	10001000 (0x88)
	PWL1R	10001010 (0x8A)
	PWL2R	10001100 (0x8C)
	PWL3R	10001110 (0x8E)
Bit(s)	Value	Description
7:6	Write	The least significant two bits for the Pulse Width Modulator count are stored
5:1		These bits are ignored.
0	0	PWM output High for single block.
	1	Spread PWM output throughout the cycle
PWM MSB x	Register	Address
	PWM0R	Address = 10001001 (0x89)
	PWM1R	Address = 10001011 (0x8B)
	PWM2R	Address = 10001101 (0x8D)
	PWM3R	Address = 10001111 (0x8F)
Bit(s)	Value	Description
7:0	write	The most significant eight bits for the Pulse-Width Modulator count are stored With a count of n , the PWM output will be high for $n + 1$ clocks out of the 1024 clocks of the PWM counter.

E.6 Quadrature Decoder

The two-channel Quadrature Decoder accepts inputs via Parallel Port F from two external optical incremental encoder modules. Each channel of the Quadrature Decoder accepts an in-phase (I) and a quadrature-phase (Q) signal, and provides 8-bit counters to track shaft rotation and provide interrupts when the count goes through the zero count in either direction. The Quadrature Decoder contains digital filters on the inputs to prevent false counts and is clocked by the output of Timer A10. Each Quadrature Decoder channel accepts inputs from either the upper nibble or lower nibble of Parallel Port F. The I signal is input on an odd-numbered port bit, while the Q signal is input on an even-numbered port bit. There is also a disable selection, which is guaranteed not to generate a count increment or decrement on either entering or exiting the disable state. The operation of the counter as a function of the I and Q inputs is shown below.

Figure E-2. Operation of Quadrature Decoder Counter

The Quadrature Decoders are clocked by the output of Timer A10, giving a maximum clock rate of one-half of the peripheral clock rate. The time constant of Timer A10 must be fast enough to sample the inputs properly. Both the I and Q inputs go through a digital filter that rejects pulses shorter than two clock periods wide. In addition, the clock rate must be high enough that transitions on the I and Q inputs are sampled in different clock cycles. The Input Capture (see the *Rabbit 3000 Microprocessor Users Manual*) may be used to measure the pulse width on the I inputs because they come from the odd-numbered port bits. The operation of the digital filter is shown below.

The Quadrature Decoder generates an interrupt when the counter increments from 0x00 to 0x01 or when the counter decrements from 0x00 to 0xFF. Note that the status bits in the QDCSR are set coincident with the interrupt, and the interrupt (and status bits) are cleared by reading the QDCSR.

Table E-5. Quadrature Decoder Registers

Register Name	Mnemonic	Address
Quad Decode Control/Status Register	QDCSR	10010000 (0x90)
Bit	Value	Description
7 (rd-only)	0	Quadrature Decoder 2 did not increment from 0xFF.
	1	Quadrature Decoder 2 incremented from 0xFF to 0x00. This bit is cleared by a read of this register.
6 (rd-only)	0	Quadrature Decoder 2 did not decrement from 0x00.
	1	Quadrature Decoder 2 decremented from 0x00 to 0xFF. This bit is cleared by a read of this register.
5	0	This bit always reads as zero.
4 (wr-only)	0	No effect on the Quadrature Decoder 2.
	1	Reset Quadrature Decoder 2 to 0x00, without causing an interrupt.
3 (rd-only)	0	Quadrature Decoder 1 did not increment from 0xFF.
	1	Quadrature Decoder 1 incremented from 0xFF to 0x00. This bit is cleared by a read of this register.
2 (rd-only)	0	Quadrature Decoder 1 did not decrement from 0x00.
	1	Quadrature Decoder 1 decremented from 0x00 to 0xFF. This bit is cleared by a read of this register.
1	0	This bit always reads as zero.
Bit	Value	Description
0 (wr-only)	0	No effect on the Quadrature Decoder 1.
	1	Reset Quadrature Decoder 1 to 0x00, without causing an interrupt.

Table E-5. Quadrature Decoder Registers (continued)

Register Name	Mnemonic	Address
Quad Decode Control Register	QDCR	Address = 10010001 (0x91)
Bit	Value	Description
7:6	0x	Disable Quadrature Decoder 2 inputs. Writing a new value to these bits will not cause Quadrature Decoder 2 to increment or decrement.
	10	Quadrature Decoder 2 inputs from Port F bits 3 and 2.
	11	Quadrature Decoder 2 inputs from Port F bits 7 and 6.
5:4	xx	These bits are ignored.
3:2	0x	Disable Quadrature Decoder 1 inputs. Writing a new value to these bits will not cause Quadrature Decoder 1 to increment or decrement.
	10	Quadrature Decoder 1 inputs from Port F bits 1 and 0.
	11	Quadrature Decoder 1 inputs from Port F bits 5 and 4.
1:0	0	Quadrature Decoder interrupts are disabled.
	1	Quadrature Decoder interrupt use Interrupt Priority 1.
	10	Quadrature Decoder interrupt use Interrupt Priority 2.
	11	Quadrature Decoder interrupt use Interrupt Priority 3.
Quad Decode Count Register	QDC1R	Address = 10010100 (0x94)
	(QDC2R)	Address = 10010110 (0x96)
Bit(s)	Value	Description
7:0	read	The current value of the Quadrature Decoder counter is reported.
